KEY WORD: n-OCTANE/ CATALYTIC CRACKING/ Y-TYPE ZEOLITE

PHANIDAR JIRATTITIKAN : CATALYTIC CRACKING OF n-OCTANE OVER
Y-TYPE ZEOLITE CATALYST. THESIS ADVISOR : SUPHOT PHATANASRI,
Dr. Eng. THESIS CO-ADVISOR : PROF. PIYASAN PRASERTHDAM, Dr. Ing.
149 pp. ISBN 974-639-111-9.

Y-type zeolites having the faujasite structure were synthesized in different forms, namely, NaY, NH₄Y, and HY. The preparation parameters studied significantly affected the acquisition of high degree of crystallization of monophasic Y-type zeolites. The optimum preparation conditions were H₂O/SiO₂ mole ratio of 46.25 ; pH of gel mixture of 13.7 ; gel preheat temperature of 60 °C; aging time at room temperature of 16 h; and crystallization conditions of 95 °C for 48 h. HY catalyst was found to obtain more strong acid site than did NH₄Y and NaY, and HY was the most active form for n-octane cracking. The maximum yield per pass (YPP) of the desired products was obtained on HY catalyst at 450 °C, 2000 h⁻¹, 30 min on stream. The self-prepared HY catalyst exhibited the comparable catalytic performance with that of the corresponding commercial one.

หน้า จิรัญดิการ : การแตกไมเกลอกของน้ำมักออกเทนด้วยตัวเร่งปฏิกิริยาซีโอลายด์
ชนิด Y (CATALYTIC CRACKING Of n-OCTANE OVER Y-TYPE ZEOLITE
CATALYST) อ.ที่ปรึกษา : ดร. ฤทธิ์ พัฒนาทร, อ. ที่ปรึกษาร่วม : ศาสตราจารย์ ดร.
ปีะสาร ประเสริฐธรรม, 149 หน้า ISBN 974-639-111-9.

ในการศึกษานี้ได้ทำการเตรียมซีโอลายด์ชนิด Y (Y-type zeolite) ที่มีโครงสร้างแบบฟ่าวาใจซ์ (Faujasite) ในรูปแบบที่แตกต่างกัน เช่น NaY, NH₄Y, HY จากการศึกษาจึงตัวแปรที่ใช้ในการเตรียม ซึ่งมีอิทธิพลต่อความบริสุทธิ์และความเป็นผลลัพธ์ของ Y-type zeolite เสื่อนไป การเตรียมที่เหมาะสมที่สุด คือ อัตราส่วน H₂O/SiO₂ 46.25 ไดชไมด์; ค่า pH ของของผสมเจล (gel mixture) 13.7; อุณหภูมิการให้ความร้อนแก่เจล (gel preheat temperature) 60 องศาเซลเซียส; เวลาบ่ม (aging time) ที่อุณหภูมิห้อง 16 ชั่วโมง; และตอกหลักที่อุณหภูมิ (crystallization temperature) 95 องศาเซลเซียสเป็นเวลา (crystallization time) 48 ชั่วโมง พบว่าตัวเร่งปฏิกิริยา HY มีความแรงของกรรมมากกว่าของ NH₄Y และ NaY และยังพบว่าตัวเร่งปฏิกิริยา HY เป็นรูปแบบที่มีความสามารถในการเร่งปฏิกิริยาการแตกไมเกลอกของน้ำมักออกเทนที่ดีที่สุด ตัวเร่งปฏิกิริยา HY จะให้ค่า YPP (yield per pass) สูงสุดที่สภาวะ 450 องศาเซลเซียส, ค่าความเร็วชิงสะปะ 2,000 ต่อชั่วโมง, เมื่อเวลา 30 นาที ตัวเร่งปฏิกิริยา HY ที่เตรียมขึ้นมีประสิทธิภาพในการเร่งปฏิกิริยาหนีบเท่ากับตัวเร่งปฏิกิริยา HY ที่ใช้ในอุตสาหกรรม

ACKNOWLEDGEMENTS

The author would like to express her gratitude and deep appreciation to her advisor, Dr. Suphot Phatanasri and Professor Dr. Piyasan Praserthdam, for their continuous guidance, supervisions and helpful suggestions throughout this study. In addition, she is also grateful to Professor Dr. Wiwut Tanthanichakoon and Assistant Professor Dr. Tharathon Mongkhonsi for serving as chairman and member of thesis committee, respectively, whose comments have been especially helpful.

Sincere thanks is made to Miss Supawadee Chaisawat, Mr. Chairat Pongtongcharoen for their helpful and their willpower.

Furthermore, many thanks go to all the members of Catalysis Research Laboratory led by Professor Piyasan Phasertdam for their assistances.

Finally, the author expresses her most sincere gratitude to her parents, who have always been the source of inspiration and affectionate encouragements.
