

CHAPTER V

CONCLUSION AND RECOMMENDATION

A new oleanane triterpene , siphonodone, was isolated along with the known triterpenoid , pristimerin , and the steroid , β -sitosterol , from the root of *Siphonodon celastrineus* Griff. (Celastraceae). The structure of siphonodone was elucidated as 3 β - acetoxy-11 α -benzoyl-13 β -hydroxyolean-12-one by spectroscopic analysis.
