APPENDIX

Growth Medium

Dissolved 9.5 g MEM powder with Earle's balance salts (Hyclone, Lot No. AJJ10788D, USA.), with L-glutamine (Sigma, Lot. No. 69H0740, USA.) without sodium bicarbonate in deionized distilled water and added 2.2g/l sodium bicarbonate (Sigma, USA). The solution was mixed well and adjusted pH to 7.2 with 6N HCl. Then, the solution was adjusted volume to 1,000 ml. This solution was sterilized by filtration (0.22 µm millipore filter membrane). Before use, this solution was supplemented with with 10% fetal bovine serum (FBS, Biochrom AG, Lot No. 230B, Berlin, Germany) and 1% antibiotic-antimycotic agents (Gibco BRL, Lot. No. 1106811, USA.) which contained 10,000 units/ml penicillin G sodium, 10,000 µg/ml streptomycin sulfate and 25 µg/ml fungizone).

Maintenance Medium

This is similar to growth medium except the amount of FBS is reduced to 5%.

Phosphate Buffer Saline Solution (PBS)

NaCl (Merck, Lot No. K27736104021, Germany)	8.00	g
KCl (May&Baker, England)	0.20	g
KH ₂ PO ₄ (Merk, Lot No. 547A17873, Germany)	0.20	g
Na ₂ HPO ₄ (May&Baker, Lot No. 50028, England)	1.15	g
Deionized distilled water to	1,000	ml

This solution is sterilized by autoclave (121⁰C, 15 psi for 15 min).

Trypsin-EDTA (1X)

Trypsin-EDTA (10X) (Biochrome AG, Lot. No. 521B, Germany)	10	ml
PBS	90	ml

Plaque Overlay medium

Solution A

2x MEM with 20% FBS and 2% antibiotic

This solution was sterilized by filtration (0.22 μm millipore filter membrane).

Solution B

Tragacanth (BP, 1973, Lot. No. TEC12 ศรีจันทร์สหโภสต, กรุงเทพฯ)	2	g
Dionized distilled water	100	ml

This solution is sterilized by autoclave (121°C, 15 psi for 15 min).

The solution A and B are mixed at a ratio of 1 : 1 before use.

1% Crystal violet in 10% formalin

Crystal violet (Schmid GMBH&Co., Lot No. 1B345, Stuttgart)	5	g
40% Formalin (Vidhyasom, Thailand)	125	ml
Deionized distilled water to	500	ml

Calculation of median cytotoxic dose (CD_{50}) by Reed-Muench method

The toxicity of medicinal plant extracts were expressed as the median cytotoxic dose (CD_{50}). This value indicated the concentration of extract that caused toxic effect to 50% of the cell population calculated by Reed-Muench method.

Table 9 Example of data arrangement for calculation of CD_{50} from extract by Reed-Muench

Extract		Number of wells		Accumulated values			
				Number of wells		Mortality	
concentration ($\mu\text{g/ml}$)	dilutio n	dead cell (a)	Survival cell (b)	dead cell (c)	Survival cell (d)	Ratio (e)	Percent (f)
1,000	10^0	▲ 4	0	4	0	4/4	100
500	$10^{-0.3}$	0	4	0	4	0/4	0
250	$10^{-0.6}$	0	4	0	8	0/8	0
125	$10^{-0.9}$	0	4	0	12	0/12	0
62.5	$10^{-1.2}$	0	4	0	16	0/16	0
31.25	$10^{-1.5}$	0	▼ 4	0	20	0/20	0

Accumulated values for the total number of cells that died or survived are obtained by adding in the directions indicated by the arrows. The accumulated mortality ratio (column e) represents the accumulated total number of dead cells (column c) over the accumulated total number inoculated (column c + column d).

From the table, the percent of accumulated values of cells mortality in the presence of extract at concentration of 1,000 $\mu\text{g/ml}$ (dilution = 10^0) was higher than 50%; and at the next lower concentration of 500 $\mu\text{g/ml}$ (dilution = $10^{-0.3}$) was lower than 50%. The proportionate distance of the 50% cytotoxicity, which obviously lied between these two dilutions, can be obtained as followed.

$$\frac{(\% \text{ mortality at dilution next above } 50\%) - 50\%}{(\% \text{ mortality at dilution next above } 50\%) - (\% \text{ mortality at dilution next below } 50\%)}$$

So that proportionate distance = $\frac{100\% - 50\%}{100\% - 0\%} = 0.5$

Since the proportionate distance between any two dilutions is a function of the incremental steps used in preparing the series; for example, 2-fold, 5-fold, 10-fold, etc; it

is necessary to correct (multiply) the proportionate distance by the dilution factor, which is the logarithm of the dilution steps employed. For example the serial 10-fold dilutions, the factor is 1 ($\log 10 = 1$), in a 2-fold dilution series, the factor is 0.3 ($\log 2$), and the factor is to be negative.

Therefore, correct proportional distance = proportional distance \times dilution factor

$$= 0.5 \times (-0.3)$$

$$= -0.15$$

Negative logarithm of CD_{50} = negative logarithm of the dilution above the 50% mortality

$$+ \text{correct proportional distance}$$

$$= -0 + (-0.15) = -0.15$$

CD_{50} is at dilution $10^{-0.15}$ which is at the concentration of 707.95 $\mu\text{g/ml}$.

Computation of ED_{50}

ED_{50} is the concentration of an antiviral agent which can inhibit plaque formation by 50% calculated from the regression formula $Y = a+b X$ or $Y = a+b \log X$; when Y = number of plaque, X = concentration of antiviral agent in $\mu\text{g/ml}$, a = intercept or the distance between X axis and the point where the regression line comed across Y axis, and b = slope.

Biography

Miss Sakulrat Rattanakiat was born on February 16, 1978 in Roi-Et province, Thailand. She received her Bachelor Degree of Science in Pharmacy in 2000 from the Faculty of Pharmaceutical Sciences, Chulalongkorn University, Thailand.
