

CHAPTER III

EXPERIMENTS

Instruments.

1. Infrared Spectrophotometers:
Perkin-Elmer model FT-IR 1760 X.
Perkin-Elmer model FT-IR 16 PC.
Perkin-Elmer model 283.
2. Nuclear Magnetic Resonance Spectrometer:
Jeol JNM-A500 (500 MHz).
3. Gas chromatograph / Mass spectrometer:
Varian Star 3400 CX. / Varian Saturn GC/MS/MS 4D.
4. Melting Point Apparatus:
Buchi capillary melting point apparatus.

Chemicals.

- Acetic anhydride (AnalaR).
Benzoic acid (Merck).
1-Bromopropane (Fluka Chemika).
N-Bromosuccinimide (Serva feinbiochemica).
Chloroacetic acid (Fluka Chemika).
Cuprous chloride (Sigma).
Dimethylsulphate (Sigma).
EthylChloroformate (Wako Pure Chemical Industries, Ltd.).
Ethyl iodide (Merck).
Hydrochloric acid, concentrated (Merck).
Hydroxylamine hydrochloride (Merck).
Nitric acid (Merck).
4-Nitrobenzoic acid (Fluka Chemika).

Palladium on activated charcoal (10% Pd) (Merck).
 Phosphorus pentachloride (May & Baker LTD.).
 Sodium metal (Reidel-de Haen).
 Sodium carbonate (Carlo Erba, AG).
 Sodium hydroxide (Merck).
 Sodium valproate (Siegfried Chemie).
 Sulfuric acid, concentrated (Merck).
 Sulfuryl chloride (Aldrich Chemical Company, Inc.).
 Tetrahydrofuran (Merck).
 Thionyl chloride (Laboratory grade).
 Toluene (Merck).
 2-Toluidine (Sigma).
 All solvents used were either B.P. or Laboratory-grade.

Benzoyl Chloride.

Method I

Mixed 75 g (0.6 mole) of pure benzoic acid and 126 g (0.6 mole) of pure phosphorus pentachloride in 500-ml round-bottom flask. Fitted the flask with a calcium chloride guard-tube and connected the latter to a gas absorption trap. Heated the flask on a water bath, with occasional shaking, until the reaction commenced and then for a further 30 minutes or until the vigorous evolution of hydrogen chloride has almost ceased: a white homogeneous liquid is formed. Distilled the mixture on an oil bath to remove the phosphorus oxychloride (b.p. 107°C) and the benzoylchloride was passed over as colorless liquid at 195-197°C. The yield was 80 g (95%).

Method II

Placed 25 g (0.2 mole) of benzoic acid and 45 g (0.35 mole) of redistilled thionyl chloride to 250 ml round-bottom flask that was fitted with a refluxed condenser and connect at the top to a gas absorption trap. Stirred the mixture and heated the flask on a water bath until the evolution gas, sulfur dioxide and hydrogenchloride, were ceased (about 5 hours). Distilled the mixture on oil bath to remove excess thionyl chloride (b.p. 67°C) and collect the benzoylchloride at 195-

197°C. The yield of the benzoylchloride, colorless liquid, was 18 g (65%).

The structure of benzoyl chloride was confirmed by IR spectrum:
(See figure 20)

IR	: 3100 - 3000 CM ⁻¹	(C-H stretch; aromatic)
(NEAT)	2000 - 1667 CM ⁻¹	(overtone or combination bands; aromatic)
1775	CM ⁻¹	(C=O stretch; acyl halide)
1724	CM ⁻¹	(fermi resonance band of C=O stretch, and overtone of aromatic of 862 CM ⁻¹)
1600, 1452	CM ⁻¹	(C=C stretch; aromatic)
862, 765	CM ⁻¹	(C-H bend; out-of-plane)
665	CM ⁻¹	(C=C bend; out-of-plane)

2-Chlorotoluene.

Dissolved 35 g (0.35 mole) of cuprous chloride in 170 ml of concentrated hydrochloric acid. Stopped the flask loosely (to prevent oxidation) and cooled it in an ice-salt mixture whilst the diazotisation was being carried out.

Dissolved 36 g (0.33 mole) of 2-toluidine in 85 ml of concentrated hydrochloric acid and 85 ml of water contained in a 750-ml conical flask or beaker. Cooled the mixture to 0°C in an ice-salt bath with vigorous stirring or shaking and a little crushed ice was added. The salt, *O*-toluidine hydrochloride, would separate as a finely divided crystalline precipitate. Added during 10-15 minutes a solution of 24 g (0.35 mole) of sodium nitrite in 50 ml of water; shook or stirred the solution well during the diazotisation, and kept the mixture at a temperature of 0-5°C by the addition of a little crushed ice from time to time. The hydrochloride would dissolve as the very soluble diazonium salt was formed; when all the nitrite solution had been introduced, the solution should contain a trace of free nitrous acid.

Poured the cold diazonium chloride solution slowly and with shaking into the cold copper(I)chloride solution. The mixture became very thick, owing to the separation of an addition product between the diazonium salt and the copper(I)chloride. Allowed the mixture to warm

up to room temperature without external heating, and shook occasionally. When the temperature reached about 15°C, the solid addition complex commences to break down with the liberation of nitrogen and the formation of an oily layer of *O*-chlorotoluene. Warmed the mixture on a water bath to about 60°C to complete the decomposition of the double salt; shook occasionally. When the evolution of nitrogen ceases, steam distilled the mixture until no more oily drops were present in the distillate. Transferred the distillate to a separatory funnel, and remove the layer of *O*-chlorotoluene. Wash was successively with 30 ml of 10% sodium hydroxide solution (to remove *O*-cresol which may be present), water, an equal volume of concentrated sulfuric acid (to remove a trace of azo compound that usually colors of the crude product and cannot be removed by distillation) and water (to remove the acid). Dried with 3-4 g of anhydrous calcium chloride, decanted or filter through a small fluted filter-paper and distilled the filtrate under atmosphere. Collected the colorless liquid, *O*-chlorotoluene, at 155-158°C; the yield was 33 g (78%).

The structure of 2-chlorotoluene was confirmed by IR spectrum:
(See figure 21)

IR	: 3100 - 3000 CM ⁻¹	(C-H stretch; aromatic)
(NEAT)	3000 - 2860 CM ⁻¹	(C-H stretch; aliphatic)
	2000 - 1667 CM ⁻¹	(overtone or combination bands; aromatic)
	1580 - 1448 CM ⁻¹	(C=C stretch; aromatic)
	1052 CM ⁻¹	(C-Cl stretch; aryl chloride)
	1022 CM ⁻¹	(C-H bend; in plane)
	720 CM ⁻¹	(=C-H bend; out-of-plane, aromatic)
	429 CM ⁻¹	(C=C bend; out-of-plane)

α-Bromo-2-chlorotoluene.

N-Bromosuccinimide was purified by recrystallization as rapidly as possible from ten times its weight of hot water or from glacial acetic acid.

Placed 36 g (0.2 mole) of *N*-bromosuccinimide, 25 g (0.2 mole) of *O*-chlorotoluene, and 150 ml of dry, redistilled carbontetrachloride in 250 ml round-bottom flask. Then added about

200 mg of benzoylperoxide. Attached a reflux condenser and allowed the mixture to stand at room temperature when after a short induction period the reaction begins. The reaction mixture became warm and the heavy yellowish. *N*-bromosuccinimide began to be transformed into the light colorless succinimide which became suspended in the reaction mixture. Then heated under reflux until all the *N*-bromosuccinimide had been converted to succinimide (about 12 hours). Cooled the flask, filter under suction and washed the residue with a little dry carbontetrachloride. Distilled the filtrate under reduced pressure and collected the α -bromo-2-chlorotoluene at 103-104°C / 10 mmHg. The yield was 33 g (82%).

The structure of α -bromo-2-chlorotoluene was confirmed by IR spectrum: (See figure 22)

IR	: 3100 - 3000 CM ⁻¹	(C-H stretch; aromatic)
(NEAT)	3000 - 2860 CM ⁻¹	(C-H stretch; aliphatic)
	2000 - 1667 CM ⁻¹	(overtone or combination bands; aromatic)
	1601 - 1440 CM ⁻¹	(C=C stretch; aromatic)
	1222 CM ⁻¹	(CH ₂ -wagging; CH ₂ -Br)
	1057 CM ⁻¹	(C-Cl stretch; aryl chloride)
	1038 CM ⁻¹	(C-H bend; in plane)
	744 CM ⁻¹	(=C-H bend; out-of-plane, aromatic)

4-Nitro-benzoylchloride.

Mixed 100 g (0.6 mole) of pure p-nitrobenzoic acid and 126 g (0.6 mole) of pure phosphorus pentachloride in 500 ml round-bottom flask. Fitted the flask with a calcium chloride guard tube and connect the latter to a gas absorption trap. Heated the flask on water bath, with occasional shaking, until the reaction commenced and then for a further 30 minutes or until the vigorous evolution of hydrogen chloride had almost ceased: a pale yellow homogeneous liquid was formed. Distilled at ordinary atmosphere to remove the phosphorus oxychloride (b.p. 107°C) either by heating in an oil bath gradually to 200-220°C or by heating in an air bath until the temperature was about 150 °C. The mixture was allowed to cool and the excess phosphorus pentachloride was washed with diethyl ether. The yield of p-nitrobenzoyl chloride, a

yellow crystalline solid (m.p. 70 °C), was 105 g (95%) and was pure enough for most purposes.

The structure of p-nitro-benzoylchloride was confirmed by IR spectrum: (See figure 23)

IR : 3100 - 3000 CM⁻¹ (C-H stretch; aromatic)
 (Nujol's) 2000 - 1667 CM⁻¹ (overtone or combination bands; aromatic)
 mull) 1775 CM⁻¹ (C=O stretch; acid chloride)
 1613, 1580 CM⁻¹ (C=C stretch; aromatic)
 842 CM⁻¹ (=C-H bend; out-of-plane, aromatic)
 3000 - 2860, 1470, and 1383 CM⁻¹ were Nujol's bands.

2-Propylpentanoyl Chloride.

Placed 50 g (0.35 mole) of 2-propylpentanoic acid and 60 g (0.5 mole) of redistilled thionyl chloride to round-bottom flask that was fitted to a reflux condenser and connect at the top to a gas absorption trap. Stirred the mixture, and heated the flask on a water bath until the evolution gases, sulfur dioxide and hydrogen chloride, were ceased (about 3 hours). The excess of thionyl chloride was distilled and residue had been stored in closely bottle.

Benzyl Chloride.

Placed 20 g (0.22 mole) of toluene, 30 g (0.22 mole) of redistilled sulphuryl chloride and about 200 mg of benzoyl peroxide to 250 ml round-bottom flask, and fitted with an efficient reflux condenser. Refluxed gently, when a vigorous reaction take place: the reaction was complete in 30 minutes. Distilled the reaction mixture first under atmospheric pressure until the temperature reached 135-140°C, and continue distillation under reduced pressure. Collected the benzyl chloride at 64-69°C / 120 mmHg. The yield of benzyl chloride was about 21.5 g (79%).

The structure of benzyl chloride was confirmed by IR spectrum:
(See figure 24)

IR	: 3100 - 3000 CM ⁻¹	(C-H stretch; aromatic)
(NEAT)	3000 - 2860 CM ⁻¹	(C-H stretch; aliphatic)
	2000 - 1667 CM ⁻¹	(overtone or combination bands; aromatic)
	1518, 1452 CM ⁻¹	(C=C stretch; aromatic)
	1053 CM ⁻¹	(CH ₂ -wagging; CH ₂ -Cl)
	1084, 1041 CM ⁻¹	(C-H bend; in plane)
	690 CM ⁻¹	(C-Cl stretch (aliphatic chloride))

Ethyl- α -chloroacetate.

Placed 50 g of chloroacetic acid to 250 ml of absolute ethanol in 500 ml round-bottom flask, then fitted to a reflux condenser. The 1 ml of concentrated sulfuric acid was added and refluxed for 15 hours. An azeotropic mixture of water and ethanol was distilled at 78°C. The residue was continuously distilled, and collected the ethyl chloroacetate at 144-146°C. The yield of the ethyl chloroacetate, colorless liquid, was 37 g (57%).

The structure of ethyl- α -chloroacetate was confirmed by IR spectrum: (See figure 25)

IR	: 3000 - 2860 CM ⁻¹	(C-H stretch; aliphatic)
(NEAT)	1757 CM ⁻¹	(C=O stretch)
	1470 - 1370 CM ⁻¹	(C-H bend)
	1313 - 1098 CM ⁻¹	(-(C=O)-O-C- stretch)
	1028 CM ⁻¹	(C-O stretch)
	782 - 699 CM ⁻¹	(C-Cl stretch)

2-Propylpentanohydroxamic Acid.

21 g (0.2 mole) of sodium bicarbonate was added to 10% water in tetrahydrofuran. Added 21 g (0.3 mole) of hydroxylamine hydrochloride and then, stirred vigorously. When carbondioxide gas ceased, the reaction was stirred continuously for 3 hours. The excess sodium bicarbonate was filtered.

Hydroxylamine solution was cooled to 10°C. Added 21 g (0.2 mole) of sodium bicarbonate with vigorous stir. The 50 g (0.3 mole) of 2-propylpentanoyl chloride was poured to dropping funnel and then, dropwised to the hydroxylamine solution during the course of 4 hours. Stirred vigorously until carbondioxide gas ceased, and the stirring was continued for 4 hours. The mixture was filtered, and the filtrate was evaporated under rotary evaporator until dried. The residue was purified by recrytallization from hexane. The yield of 2-propylpentano hydroxamic acid as white needle, m.p. 124-125°C, was 38 g (78%).

The structure of 2-propylpentanohydroxamic acid was confirmed by:

EIMS : m/z 159 (M), 144, 142, 126, 100, 99, 98, 72, 57, 55, 41.
 (See figure 30)

Sodium-2-propylpentanohydroxamate.

Placed 50 ml of absolute ethanol to 100 ml round-bottom flask and cooled in the ice-salted bath. Added 2.3 g (0.1 mole) of sliced sodium metal to the absolute ethanol with vigorous stir until the sliced sodium metal were disappeared, and the sodium ethoxide was formed. Poured the solution to a dropping funnel, and connected to anhydrous calcium chloride guard tube.

Dissolved 15 g (0.1 mole) of 2-propylpentanohydroxamic acid in 50 ml of absolute ethanol. Dropwised the sodium ethoxide during the course of 2 hours; white precipitate, water soluble substance, was formed. Added 50 ml of dried diethylether, then filtered the content by using suction filtration. The precipitate, sodium-2-propylpentano hydroxamate, was dried and kept in vacuum desiccator.

Ethyl- α -(2-propylpentamidoxy)acetate.

Dissolved 1.2 g (0.03 mole) of sodium hydroxide with minimum quantity of purified water in 10-ml beaker. Dissolved 5 g (0.03 mole) of 2-propylpentanohydroxamic acid with 25 ml of dried, and redistilled tetrahydrofuran in 100-ml round-bottom flask. Dropwised the sodium hydroxide solution very slowly and stirred vigorously until the clear solution became opaque. Dropwised 3.7 g (0.03 mole) of ethyl chloroacetate and fitted the flask with refluxed condenser that connected anhydrous calcium chloride guard tube at the top. Refluxed the mixture on a water bath for 10 hours. The mixture was evaporated by rotary evaporator, and the residue was extracted with 50 ml of 25% sodium carbonate solution and 50 ml redistilled chloroform. Collected the chloroform layer and washed with three 50 ml portion of purified water. Removed the water layer, and the chloroform layer was dried with anhydrous sodium sulfate. Evaporated the chlorofom on a water bath (rotary evaporator), and then the residue was purified with a silica gel column, eluted with hexane. The yield of Ethyl- α -(2-propylpentamidoxy) acetate was 3.5 g (46%).

The structure of ethyl- α -(2-propylpentamidoxy)acetate was confirmed by:

 (See figure 55)

(2-Chlorobenzyl)-2-propylpentanohydroxamate.

Used 1.2 g (0.03 mole) of sodium hydroxide, 5 g (0.03 mole) of 2-propylpentanohydroxamic acid, and 6.2 g (0.03 mole) of 2-chlorobenzyl chloride. Proceed as for ethyl- α -(2-propylpentamidoxy) acetate but heated under reflux for 4 hours. The yield of (2-chlorobenzyl)-2-propylpentanohydroxamate as white needle was 7.4 g (83%), m.p. 104-106°C, after recrystallization in hexane.

The structure of (2-chlorobenzyl)-2-propylpentanohydroxamate was confirmed by:

IR : 3200 CM⁻¹ (N-H stretch)

Ethyl-2-propylpentamidoxy Formate.

Added 3.5 g (0.02 mole) of sodium-2-propylpentano hydroxamate to 25 ml of dried and redistilled tetrahydrofuran in 100 ml round-bottom flask. Dropwised 2.2 g (0.02 mole) of ethylchloroformate, and then stirred the mixture at 0-10°C for 15 hours. Subsequently, the mixture was evaporated by using the rotary evaporator (very low temperature was used). The residue was dissolved in 50 ml of chloroform and extracted with three 50 ml portions of purified water. After that, the chloroform layer was dried with anhydrous sodium sulfate. Collected the chloroform layer and removed on a water bath (rotary evaporator) with very low temperature. The residue was purified by recrystallization in diluted methanol. The yield of the compound as white needle, m.p. 82-83°C, was 3.2 g (72 %).

The structure of ethyl-2-propylpentamidoxy formate was confirmed by:

 (See figure 76)

2-Propylpentanohydroxamic 4-Aminobenzoic Anhydride.

Dissolved 3 g (0.01 mole) of 2-propylpentanohydroxamic 4-nitrobenzoic anhydride in 25 ml of absolute ethanol. The solution was added to a Parr hydrogenation bottle. A little amount of catalyst, 10% palladium on activated charcoal was added, and then subjected to low-pressure hydrogenation (45 psi) for 10 hours. The contents were filtered by using filtered-paper, the black precipitate was filtered out. The filtrate was evaporated. Add 25 ml of benzene, then filtered the mixture. The filter, pale orange precipitate, was purified by recrystallization from ethylacetate. The purified product, 2-propylpentanohydroxamic 4-aminobenzoic anhydride, was precipitate as pale yellow crystals. The yield of the final product, m.p. 154-155°C, was 1.8 ml (73%).

The structure of 2-propylpentanohydroxamic 4-aminobenzoic anhydride was confirmed by:

IR : 3540	CM^{-1} (N-H stretch; sym, primary amine)
(KBr 3460	CM^{-1} (N-H stretch; asym, primary amine)
Pellet) 3248	CM^{-1} (N-H stretch)
