Appendix A

DATA RECORDING

The field data is encoded on a standard data card. The data recorded on the card is punched onto an 80-column IBM data card for computer processing, storage and retrieval. Even if no computing facility were available it would be desirable to record data in this form because in this way the samples are forced to record the desired information in a standard format and the data is always ready for keypunching at a later date.

The geochemical drainage sample card is used for surveys of stream sediments, water or other material, carried out in the drainage channels of a region.

The data card has a heading strip, and positions to record data for five samples: The various fields are defined on the heading and are shaded alternately dark and light for easy recognition. The first 27 columns are taken up with map sheet and sample number and sample location co-ordinates. These are essential items of information which must accompany every sample. Column 28 defines the type of sample taken during the drainage survey.

The physical environment of the sample site is described in card columns 29 to 44, and includes observations on geology, stream regime and landform. Card column 45 to 50 describe the sample itself in terms of grain size distribution. The presence of contamination is noted in column 51. This is concerned with contamination due to human activities which would be reflected in the sample analysis. Card columns 52 to 56 are reserved for recording pH and temperature of the

REMARKS:

water if these are measured.

At every sample site a scintillometer reading is taken. The reading is recorded in card columns 57 to 59 to a maximum reading of 999. However, in this investigation card columns 52 to 59 are ignored because the pH of water, temperature and scintillometer reading are not operated in the field.

In card column 60 land use is recorded, to allow recognition of those areas. In a more general way, this data might be of use, in conjunction with the metal values, to agriculturalists, finally, card columns 76 to 80 are devoted to a data record code. The year of data collection is recorded in card column 76 and 77, the initials of the agency carrying out the survey are recorded in card columns 78 and 79, card column 80 records the type of data file-number 1 in this column means a drainage sample record of field observations. These five columns permit the formation of a data storage and retrieval system which could, if desired, be expanded into a national system for all types of earth science data.

Coding Form of Geochemical Drainage Sample Card

CC 1 to 12: Sample Number: The sample number is in two parts. The four numbers are the topographic map sheet number (1: 50,000 scale) within which the sample is located. This is entered in CC. 1-5. CC. 6 is left blank. CC. 7-12 are the sample numbers. The last digit of the number always goes in CC.12. It is not necessary to enter zeros before the actual number. Thus sample number 22 could be entered simply as 22 in CC. 11 and 12, or as 000022 in CC. 7-12.

CC. 13 to 27: Sample Location: Sample locations are recorded in the UTM (Universal Transverse Mercator) Grid System, which is printed on new editions of the topographic maps. The location includes a zone number (CC. 13 and 14); an easting of six digits (CC. 15-20); and a northing of seven digits (CC. 21-27).

28: Sample Type: Enter the appropriate number in CC. 28.

1. = Water; lake or pond
2. = Water; stream
3. = Water; spring or well or drillhole
4. = Water; swamp or marsh
5. = Sediment; stream
6. = Sediment; stream, heavy mineral concentrate
7. = Sediment; swamp or marsh
8. = Soil (bank)
9. = Bedrock

29 to 30: Geological Unit: To be entered in field office by geological supervisor. This refers to geological unit underlying sample point.

31 to 33: Width of Stream: In meters, estimate to nearest 10th of a meter, or meter, depending on width. The decimal point to be added when necessary.

34 to 36: Depth of Stream: To nearest 0.1 meter. Greater than 9.9 If dry (CC. 38 = 0) leave blank.

CC 37: Rate of Flow at Sample Point:

0. = stagnant
1. = slow
2. = moderate
3. = fast
4. = torrent (very fast)

38: Water Level:

0. = dry
1. = low
2. = normal
3. = high
4. = flood

39: Sample position - looking down stream: Locate position of sample point in the stream or river.

1. = right bank (soil)
2. = right bank (sediment or water)
3. = centre
4. = left bank (sediment or water)
5. = left bank (soil)

40: Nature of banks:

1. = alluvial - banks are older stream channel deposits
2. = colluvial - banks are soil covered slopes
3. = diluvial - flood plain material
4. = rocks - banks are rock outcrops
5. = elluvial - banks are residual soil

CC. 41: Relief: General relief in area of sample point

0. = flat 0-10 meters
1. = low 10-30 meters
2. = moderate 30-100 meters
3. = high 100-300 meters
4. = mountainous 300 meters and greater

42: Color of Water:

0. = clear
1. = white
2. = yellow
3. = red
4. = brown
5. = black
6. = buff
7. = grey

43: Color of Sediment:

1. = white
2. = grey
3. = yellow
4. = buff
5. = red
6. = brown
7. = black
8. = sandy (yellow/orange)

CC. 44: Presence of precipitate or stain on stream deposit:

0 = none

1 = Iron (red or brown)

2 = Manganese (black)

3 = Carbonate (white)

4 = Sulphur (yellow)

5 = Organic (dark brown or black - distinguished
from Manganese)

45 to 50: Size Composition of Sediment Sample: If sample is water, leave blank. The size classes are:

Gravel (CC. 45)

Coarse Sand (CC. 46)

Fine Sand (CC. 47)

Silt (CC. 48)

Clay (CC. 49)

Organic (CC. 50)

A visual estimate is required of the grain size composition of the sample. Estimate to the nearest 10 %. The total recorded in CC. 45-50 is therefore 10 which equals 100%. If a sample is entirely of one size class, enter 9 in that column and leave the rest blank.

51: Contamination: Note the presence of known or suspected contamination from old mine workings, dumps, slag piles, agricultural sprays or other human agencies. Always note in the remarks section what the contamination is thought to be.

CC 0 = none
 1 = possible
 2 = probable
 3 = definite

52 to 54: pH of water - to be recorded here if measured.

55 to 56: Temperature of water in C. if measured

57 to 59: Scintillometer reading (in CPS) - Average background of area around sample site, holding the scintillometer at knee level and avoiding as far as possible mass effect of cliffs and overhanging rocks.

Note :

60: Land Use:

0 = mountainous

1 = grazing

2 = forestry

3 = arable

4 = orchards

5 = vineyards

76 to 80: Agency Code:

76-77 = Year of sample collection.

78-79 - Initials of organization carrying
out sampling programme.

80 - Type of data collected. This card, card
No. 1, is recognized as a field data

card for drainage surveys. As other types of data cards are developed they will be given other numbers.

Coding Form of Geochemical Soil Card

CC 1 to 27 This area is identical to that on the drainage card and is to be filled out in the same way.

28 Sample type: Three numbers might be entered here to define the sample type:

7 = sediment, swamp or marsh

8 = soil

9 = bed rock

29 to 34 Line and Station: The location of the sample on the sample

35 to 40 Sample on the sample grid is entered here. Lines and stations are numbered from an arbitrary origin in meters and will normally be disposed N-S and E-W.

Line 100 N is 100 meters north of the origin and would be entered as 100 N. Station 400 E is 400 meters east of the origin and would be entered 400 E.

41 to 44 Slope: Slope is measured in degrees with the clinometer on your compass. The downslope direction is recorded as N, NE, E, etc. A slope might be recorded 10 N with the last space blank, or 10 NE using all four spaces.

CC 45 Landuse: As in the drainage card:

- 0 = mountainous, little grazing
- 1 = grazing
- 2 = forestry
- 3 = cultivated, if land has been plowed
- 4 = orchards
- 5 = vineyards
- 6 = habitation

46 Vegetation:

- 0 = plowed land
- 1 = grass
- 2 = grass and low bushes
- 3 = bushes
- 4 = sparse trees, bushes and/or grass
- 5 = forest
- 6 = burnt forest

47 Soil type: Classify the soil into this simple grouping:

- 0 = no soil profile recognizable
- 1 = poor profile development, Band C just recognizable
- 2 = good profile - A horizons recognizable
- 3 = gleysol-poorly drained soil, usually grey but may have mottling, usually reduced Fe
- 4 = humic soil-thick organic soil to normal sample depth

CC 48 Horizon sampled:

- 0 = A₀ humus layer
- 1 = A₂ leached horizon
- 2 = B red oxidized, enriched in Fe
- 3 = B-C mixed
- 4 = C weathered parent material
- 5 = R underlying consolidated bedrock

49 to 50 Depth samples: Record in centimeters to the nearest
5 cm., from bottom of auger

51 to 52 Color : See Color chart

- | | |
|------------------|----------------|
| 0 = white | 5 = red |
| 2 = buff | 6 = brown |
| 3 = yellow | 7 = dark brown |
| 4 = yellow brown | 8 = black |
| 5 = red brown | 9 = grey |

53 Moisture:

0 = dry

1 = damp (moderately dry)

2 = moist

3 = wet

54 Drainage:

0 = poorly drained

1 = moderately drained

2 = well drained

3 = excessively drained

CC 55 to 59 Texture (particle size composition)

Column 55 = gravel	{ estimate to the nearest 10 % Total of these = 10
56 = sand	
57 = silt	
58 = clay	
59 = organic	

60 Parent Material:

- 0 = bedrock
- 1 = colluvial
- 2 = alluvial

61 to 62 Special Features: Note here the presence of such features as CaCO_3 , Mn or Fe crusts etc. as follows:

- 01 - calcium carbonate crust
- 02 - iron crust
- 03 - manganese crust
- 04 - silica crust
- 05 - particularly hard or impervious clay layers
- 06 -

Note: this section will be expanded as needed.

63 Contamination: Note here contamination due to the activity of man-as in the drainage card.

- 0 = none
- 1 = possible

CC

2 = probable

3 = definite

64 to 67 Radioactivity: Radioactivity reading taken with the
Srat SPP-2 or equivalent scintillometer

68 to 70 Radon: Record here the net counts per minute calculated
on the Radon sheet

74 to 75 Anomaly: Record here the code letters of the anomaly
block being investigated, e.g. SR = Serrai

78 to 79 Year: Year of sampling.

The card columns 64 to 70 are not recorded because they are not
treated in the field operation.

Biography

Mr. Pinit Kunavat was born in Nakorn Nayok, Thailand, on February 9, 1947. He graduated with a B.Sc. in Geology from Department of Geological Science, Faculty of Science, Chiang Mai University in 1970. Then he started his career with Economic Geology Division, Department of Mineral Resources as exploration geologist. In 1972-1975, he was assigned to work on the exploration of heavy minerals in the southern Thailand, oil shale at Mae Sot, Tak, rock salt and potash salt in the northeastern. From 1976 to present, he was assigned to work as geochemical exploration geologist dealing with geochemical exploration both regional and detailed scales. In the last few years, his task concentrated on the regional geochemical investigation in the western Thailand. He participated in several workshops and training programme, i.e. training on using computer for science and technology in September 1981 at Chulalongkorn University, training on evaluation with computer in March 1983 at the National Statistics Office.
