(PHYTOCHEMICAL STUDY OF *CRYPTOLEPIS BUCHANANI STEM*)

อ. ที่ปรึกษาวิทยานิพนธ์หลัก: รศ. ดร.รพีพล ภิญญาท, 167 หน้า.

จากลำดับของเดาอีนอ่อน วงศ์ Asclepiadaceae สามารถสกัดแยกสารใหม่ในกลุ่ม pregnane steroids ได้ 3 ชนิด คือ  $2\alpha,21$ -dihydroxypregn-4-ene-3,20-dione,  $2\alpha,21$ -dihydroxypregn-4,6-diene-3,20-dione และ  $2,21$ -dihydroxypregn-1,4,6-triene-3,20-dione รวมทั้งพบสารที่เกบมีรายงานมาแล้วอีก 4 ชนิด ได้แก่ สารกลุ่ม coumarin 1 ชนิด คือ scopoletin สารกลุ่ม anthraquinone 1 ชนิด คือ danthon และสารพสมในกลุ่ม stigmastane steroids 2 ชนิด คือ  $\beta$ -sitosterol กับ stigmasterol การพิสูจน์เอกลักษณ์ของสารเหล่านี้ ทำโดยการวิเคราะห์ข้อมูลทางスペกตรสโคปี จาก UV, IR, MS, 1-D NMR ( $^1\text{H-NMR}$ ,  $^{13}\text{C-NMR}$ ,  $^{13}\text{C-DEPT}$ ) และ 2-D NMR ( $^1\text{H-}^1\text{H COSY}$ ,  $^1\text{H-}^{13}\text{C HMQC}$ ,  $^1\text{H-}^{13}\text{C HMBC}$ ) ร่วมกับการเปรียบเทียบข้อมูลกับค่าที่ได้มีการรายงานไว้แล้ว

KEY WORD : *CYPTOLEPIS BUCHANANI* / ASCLEPIADACEAE / PREGNANE / ANTHRAQUINONE / COUMARIN

AMORNTHIP SOMSOOK: PHYTOCHEMICAL STUDY OF *CYPTOLEPIS BUCHANANI* STEM. THESIS PRINCIPAL ADVISOR: ASSOC. PROF. RAPEPOL BAVOVADA, Ph.D., 167 pp.

From the stem of *Cryptolepis buchanani* Roem. & Schult. (family Asclepiadaceae), three new naturally occurring pregnane steroids,  $2\alpha,21$ -dihydroxypregn-4-ene-3,20-dione,  $2\alpha,21$ -dihydroxypregn-4,6-diene-3,20-dione and  $2,21$ -dihydroxypregn-1,4,6-triene-3,20-dione, were isolated together: a coumarin, scopoletin; an anthraquinone, danthron; and a mixture of steroids,  $\beta$ -sitosterol and stigmasterol. Identification and structure elucidation of these compounds were accomplished by analyses of their spectroscopic data: UV, IR, MS, 1-D NMR ( $^1\text{H-NMR}$ ,  $^{13}\text{C-NMR}$ ,  $^{13}\text{C-DEPT}$ ) and 2-D NMR ( $^1\text{H-}^1\text{H COSY}$ ,  $^1\text{H-}^{13}\text{C HMQC}$ ,  $^1\text{H-}^{13}\text{C HMBC}$ ) as well as comparison with reported values.

## **ACKNOWLEDGEMENTS**

The author wishes to express her deepest gratitude to her thesis advisor, Associate Professor Rapepol Bavovada of the Department of Pharmaceutical Botany, Faculty of Pharmaceutical Sciences, Chulalongkorn University, for his advice, guidance, constant help and encouragement throughout the course of this study.

The author is beholden to Associate Professor Dr. Rutt Suttisri of the Department of Pharmaceutical Botany, Faculty of Pharmaceutical Sciences, Chulalongkorn University, for his concern, kind assistance and valuable advice and discussion.

The author would like to express her deep appreciation to Associate Professor Dr. Ekarin Saifah, head of the Department of Pharmaceutical Botany, Chulalongkorn University, for his kindness and help throughout the course of his study.

The author would like to thank all members of her thesis committee for their critical perusal and for serving on her examination committee.

The author would like to thank the Graduate School of Chulalongkorn University for granting partial financial support to conduct this investigation.

The author would like to express her appreciation and thanks to all staff members of the Department of Pharmaceutical Botany, Faculty of Pharmaceutical Sciences, Chulalongkorn University, for their contribution and unforgettable friendships.

Finally, the author wishes to express her infinite gratitude to her family for their love, understanding and encouragement.

## CHAPTER I

### INTRODUCTION

A large number of medicinal plants are distributed all over Thailand, many of which have been employed by native practitioners to treat diseases in the form of traditional remedies. It is considered that medicine of natural origins is usually safer than synthetic drugs. Therefore, it is quite interesting to investigate medicinal plants of Thailand, many of which still lack basic informations on its chemical constituents.

*Cryptolepis buchanani* Roem. & Schult. has a long association with Thai folk medicine. The genus *Cryptolepis* belongs to the family Asclepiadaceae, a large and diverse family with about 315 genera and over 2,900 species mostly in warm regions with a few species in temperate habitats (Woodland, 2000). In Thailand, asclepiadaceous plants are arranged into about 45 genera and 150 species (ส่วนพุกมยาสตร์ป่าไม้ สำนักวิชาการป่าไม้ กรมป่าไม้, 2544). The genus *Cryptolepis* comprises a number of glabrous, usually twining shrubs with opposite leaves. The flowers are small, in axillary lateral or terminal lax usually few-flowered pedunculate cymes. The calyx is 5-partite, while the corolla-tube is short, cylindric or campanulate with 5 lobes overlapping to the right in bud. The corona is 5 filiform or fleshy lobes or processes arising from about the middle of the corolla-tube. Stamens inserted towards the base of the corolla-tube; filaments free; anthers more or less triangular with the connective produced into a fleshy apiculus, united at their base to the dilated part of the style, more or less connivent into a cone; pollen-masses granular, cohering in pairs in each cell; pollen-carriers more or less spathulate. Style-apex shortly conical, not exserted beyond the anther. Follicles divaricate, terete, smooth. Seeds comose (Kirtikar and Basu, 1981)

The genus *Cryptolepis* includes about 73 species distributed throughout the tropical regions of Africa, Madagascar, Asia, Australia and Papua New Guinea. (Good, 1952; Paulo and Houghton, 2002; The International Plant Names Index, 2008). These species are:

<i>C. subgen. Phyllanthera</i> (Blume) P.I.Forst.	<i>C. africana</i> (Bullock) Venter & R.L.Verh.
<i>C. albicans</i> Jum. & H.Perrier	<i>C. angolensis</i> Welw. ex Hiern
<i>C. apiculata</i> K.Schum. ex Engl.	<i>C. arbuscula</i> (Radcl.-Sm.) Venter
<i>C. arenicola</i> Schltr.	<i>C. barteri</i> K.Schum.

<i>C. baumii</i> N.E.Br.	<i>C. bifida</i> (Blume) P.I.Forst.
<i>C. brazzaei</i> Baill.	<i>C. buchanani</i> Roem. & Schult.
<i>C. buxifolia</i> Chiov.	<i>C. capensis</i> Schltr.
<i>C. cryptolepioides</i> (Schltr.) Bullock	<i>C. debeerstii</i> De Wild.
<i>C. decidua</i> N.E.Br.	<i>C. delagoensis</i> Schltr.
<i>C. dubia</i> (Burm.f.) M.R.Almeida	<i>C. eburnea</i> (Pichon) Venter
<i>C. edithae</i> Benth. & Hook.f.	<i>C. elegans</i> Wall. & G.Don
<i>C. elliotii</i> Schltr.	<i>C. filiformis</i> Wall.
<i>C. gilletti</i> Hutch. & E.A.Bruce	<i>C. gossweileri</i> S.Moore
<i>C. grandiflora</i> Wight	<i>C. grayi</i> P.I.Forst.
<i>C. hensii</i> N.E.Br.	<i>C. hypoglauca</i> K.Schum. ex Engl.
<i>C. intricata</i> (Balf.f.) Venter	<i>C. javanica</i> Blume
<i>C. lancifolia</i> P.I.Forst.	<i>C. laurenti</i> De Wild.
<i>C. laxa</i> Baill.	<i>C. laxiflora</i> Blume
<i>C. linearis</i> N.E.Br.	<i>C. longiflora</i> Regel
<i>C. macrophylla</i> (Radcl.-Sm.) Venter	<i>C. microphylla</i> Baill.
<i>C. migiurtina</i> Chiov.	<i>C. monteiroae</i> Oliver
<i>C. multinervosa</i> P.I.Forst.	<i>C. myrtifolia</i> Hiern
<i>C. newii</i> (Benth.) P.I.Forst.	<i>C. nigritana</i> N.E.Br.
<i>C. nugaalensis</i> Venter & Thulin	<i>C. nymanii</i> (Schumann) P.I.Forst.

<i>C. orbicularis</i> Chiov.	<i>C. papillata</i> P.I.Forst.
<i>C. pauciflora</i> Wight	<i>C. pendulina</i> (Venter & D.V.Field) P.I.Forst.
<i>C. perakensis</i> (Gamble) P.I.Forst.	<i>C. producta</i> N.E.Br.

<i>C. purpureus</i> (N.E.Br.) P.I.Forst.	<i>C. reticulata</i> (Roxb.) Steud.
<i>C. reticulata</i> Wall.	<i>C. ruspolii</i> Chiov.
<i>C. sanguinolenta</i> (Lindl.) Schltr.	<i>C. sinensis</i> Merr.
<i>C. sizenandi</i> Rolfe	<i>C. socotrana</i> (Balf.f.) Venter
<i>C. somaliensis</i> Venter & Thulin	<i>C. stefianinii</i> Chiov.
<i>C. suffruticosa</i> N.E.Br.	<i>C. transvaalensis</i> Schltr.
<i>C. triangularis</i> N.E.Br.	<i>C. volubilis</i> (Balf.f.) Schwartz
<i>C. welwitschii</i> Schltr.	<i>C. wightiana</i> Wall.
<i>C. yemenensis</i> Venter & R.L.Verh.	

In Thailand, at least two species of *Cryptolepis* have been recorded: *C. buchanani* and *C. elegans* (ส่วนพุกษาศาสตร์ป่าไม้ สำนักวิชาการป่าไม้ กรมป่าไม้, 2544)

*Cryptolepis buchanani* Roem. & Schult. (Figure 1) is an indigenous plant known in Thailand, as Thao en on (ถ้าอื้นอ่อน). Mueai (central), Kuan (Shan-Mea Hong Son), No-o-mi (Karen-Mae Hong Son), Khrua thao en (Chiangmai), Tin pet khrua (Northern), Mon tin pet (Surat Thani), Ya-li-len (Pattani) or Khrua mak hoa toa (Northeastern) (สายสัมภพ คิตติชร, 2526; ส่วนพุกษาศาสตร์ป่าไม้ สำนักวิชาการป่าไม้ กรมป่าไม้, 2544). It is a large twining shrub; branches terete, glabrous. Leaves 7.5-12.5 by 3.8-6.3 cm., elliptic-oblong or sometimes oblong-lanceolate, rounded, retuse, or sometimes acute, apiculate, green above, whitish beneath, glabrous, base usually acute; main nerves numerous slender, nearly at right angles to the midrib, uniting in an intramarginal nerve; petioles 6-13 mm. long. Flowers greenish yellow, in short paniculate cymes; pedicels glabrous; bracts ovate, acute, with scarious margins. Calyx glabrous; segments 1.5 mm. long, ovate, subacute. Corolla tube 2 mm. long; lobes 6 mm. long, linear or linear-lanceolate, subacute; corona-scales clavate. Follicles 5-10 cm. long, straight, rigid, divaricate, gradually tapering to a blunt point from about the middle, where they are 1.3-2 cm. diam. Seeds 6-8 mm. long, ovate-oblong, black; coma rather more than 2.5 cm. long (Kirtikar and Basu, 1981).

The plant can be found throughout India, Kashmir, Laos, Myanmar, Nepal, Vietnam, Sri Lanka, Thailand and China. (Kirtikar and Basu, 1981; Wu and Raven, 1995).

In Thai folk medicine, the alcoholic extract of its stem is commonly used in the treatment of inflammatory conditions such as arthritis, muscle and joint pain (Panthong, Kanjanapothi and Taylor, 1986).

The main secondary metabolites found in the leaves and roots of *C. buchanani* are cardenolides and pseudo-alkaloids (nicotinoyl glycosides) (Dutta, Sharma and Sharma, 1980 Purushothaman *et al.*, 1988) Some of these compounds and crude extracts from the plant have been found to exhibit interesting biological activities e.g. antibacterial (Vasanth, Gopal and Roa, 1997), cardiotonic (Venkateswara, Sankara Rao and Vaidyanathan, 1987), muscle relaxant (Ikegami *et al.*, 1990) and anti-inflammatory activities (Laupattarakasem *et al.*, 2006)

Although *C. buchanani* has been frequently used in medicine, there are only a few reports on the phytochemical study of this plant. Preliminary examination revealed positive results for alkaloids, flavonoids, triterpenoids and steroids. Therefore, it is the purpose of this investigation to study the compounds in the stem of *C. buchanani*. The result of this investigation may serve as an additional information on the chemical nature of this plant family, which could be a valuable lead in the fields of chemotaxonomy and phytochemistry. The purposes of this research were as follows:

1. Isolation and purification of compounds from the stem of *Cryptolepis buchanani*.
2. Determination of chemical structure and physical properties of each isolated compound.

Figure 1. *Cryptolepis buchanani* Roem. & Schult.

## CHAPTER II

### HISTORICAL

#### Chemical constituents of asclepiadaceous plants

##### Pregnane Steroids

Several types of compounds have been recorded in previous phytochemical studies of plants belonging to the family Asclepiadaceae. The Asclepiadaceae was reported to be rich in pregnane and their glycosides (Khare *et al.*, 1986; Prakash *et al.*, 1991; El Sayed *et al.*, 1995; Halim and Khalil, 1996; Warashina and Noro, 1997; Al-Yahya, Abdel-Sattar and Guittet, 2000; Sigler *et al.*, 2000; Leo *et al.*, 2005; Abdel-Sattar *et al.*, 2007), drawing much attention in recent years due to their antitumor and anticancer (Ahsah *et al.*, 1973; Aquino and Pizza, 1995; Qin *et al.*, 1999; Pan *et al.*, 2003), platelet pro-aggregating (Piacente *et al.*, 1998), anti-fungal (Hu *et al.*, 1999), immunodulating and immunosuppressive (Li *et al.*, 2006b; Ye *et al.*, 2005), antiepilepsy (Mu *et al.*, 1986), antifertility (Y aun *et al.*, 1992), anti-inflammatory (Aquino and Pizza, 1995; Bai, Li and Koike, 2008; Innocenti *et al.*, 2005; Ramesh *et al.*, 1999), antinociceptive (Verma *et al.*, 2005) and digitalis receptor binding activities (Thempleton *et al.*, 1993).

Pregnanes are C-21 steroidal compounds having the perhydro-1,2-cyclopentano phenanthrene ring system with  $\beta$ -orientated angular methyl group at C-10 and C-13, and a two carbon atom side chain at C-17. It is quite normal that pregnane derivatives of the Asclepiadaceae possess a  $14\beta$ -hydroxy moiety,  $\Delta^5$  unsaturation, and a  $\beta$ -hydroxy group at C-3 like in many other naturally occurring steroidal compounds. Pregnanes are the parent hydrocarbon of the pregnancy hormone, progesterone (pregn-4-ene-3,20-dione), and of the great majority of the corticosteroids and many other natural products, which together make the pregnanes the largest single group of steroids. Distribution of pregnane steroids in Asclepiadaceae as shown in Table 1

**Table1. Distribution of pregnane steroids in the family Asclepiadaceae**

<i>C. paniculatum</i>	n.s.	Neocynaponoside A [192]		Sugama and Hayashi, 1988
<i>C. taiwanianum</i>	Root	Taiwanoside A [193]	Metaplexigenin	Lin and Lin, 1995
	Root	Taiwanoside B [194]	Metaplexigenin	Lin and Lin, 1995
	Root	Taiwanoside C [195]	Metaplexigenin	Lin and Lin, 1995
<i>C. taiwanianum</i>	Root	Taiwanoside D [196]	Sarcogenin	Lin and Lin, 1995
	Root	Taiwanoside E [197]	Sarcogenin	Lin and Lin, 1995
	Root	Wilfooside C1N [198]	Caudatin	Tsukamoto, Hayashi and Mitsuhashi, 1985a.
	Root	Wilfooside C2N [199]	Caudatin	Tsukamoto, Hayashi and Mitsuhashi, 1985a.
	Root	Wilfooside M1N [200]	Sarcogenin	Tsukamoto, Hayashi and Mitsuhashi, 1985b.
	Root	Wilfooside K1N [201]	Sarcogenin	Tsukamoto, Hayashi and Mitsuhashi, 1985b.
<i>C. versicolor</i>	n.s.	Neocynaversicoside [202]		Sheng, Zhou and Zhou, 1990

<i>Stephanotis mucronata</i>	Stem	Mucronatoside H [413]		Li <i>et al.</i> , 2006b
<i>Streptocaulon tomentosum</i>	Root	Pregn-5-ene-20-one-3 $\beta$ ,16 $\alpha$ -diol-d-O-[2,4-O-diacetyl- $\beta$ -digitalopyranosyl-(14)- $\beta$ -D-cymaropyranoside]-16-O-[\mathbf{\beta-D-glucopyranosides}] [414]		Khine <i>et al.</i> , 2007
<i>Trachycalymma fimbriatum</i>	Root	3 $\beta$ -Hydroxypregn-14-ene-20-one [415]		Bach, Capitaine and Engel, 1968
	Root	3,8,14-Trihydroxypregn-20-one [416]		Elber, Weiss and Reichstein, 1969
<i>Tylophora sylvatica</i>	Root	Tylogenin [417]		Gnabre <i>et al.</i> , 1991

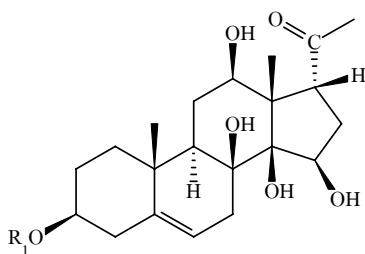

**Table1. Distribution of pregnane steroids in the family Asclepiadaceae (continued)**

<b>Plant source</b>	<b>Plant part</b>	<b>Chemical compound</b>	<b>Genin</b>	<b>Reference</b>
<i>Tylophora sylvatica</i>	Root	Tylophoroside [418]		Gnabre <i>et al.</i> , 1991
<i>Tylophora sylvatica</i>	n.d.	Acetyltylophoroside [419]		Gnabre and Pinnas, 1991
<i>Vincenticum hirundinariae</i>	Root	Cynatratoside E [420]	Glucogenin A	Lavault, Richomme and Bruneton, 1999
	Root	Cynatratoside C [421]		Lavault, Richomme and Bruneton, 1999
	Root	Hirundigoside B [422]		Lavault, Richomme and Bruneton, 1999
	Root	Hirundigoside C [423]		Lavault, Richomme and Bruneton, 1999
	Root	Hirundicoside D [424]		Lavault, Richomme and Bruneton, 1999
<i>V. officinale</i>	Root	Anhydrohirundigenin [425]		Kennard <i>et al.</i> , 1968; Stockel, Stocklin and Reichstein, 1969
	Root	Hirundoside A [426]		Kennard <i>et al.</i> , 1968; Stockel, Stocklin and Reichstein, 1969
	Root	Hirundigenin [427]		Kennard <i>et al.</i> , 1968; Stockel, Stocklin and Reichstein, 1969

### Chemical constituents of *Cryptolepis* species

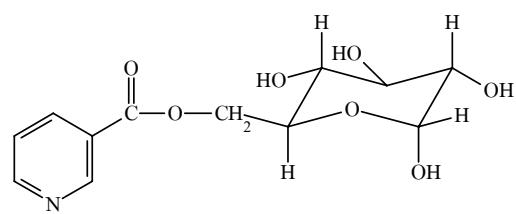

Only three *Cryptolepis* species have been phytochemically studied. The roots of *Cryptolepis sanguinolenta* were found to be rich in bioactive indole alkaloids (Paulo *et al.*, 2000a). This type of alkaloids is very common in the closely related Apocynaceae family but is seldom found in Asclepiadaceae. Alkaloids are rarely found in this family, the phenanthroindolizidines and phenanthroquinolizidines alkaloids were found in the genera *Tylophora* and *Cynanchum*. The steroid alkaloids isolated from *C. obtusa* are of the pregnane type similar to those identified in Apocynaceae (Paulo *et al.*, 2000b). The main secondary metabolites previously found in the leaves and roots of *C. buchanani* are cardenolides and pseudo-alkaloids (nicotinoyl glycosides) (Dutta *et al.*, 1980; Purushothaman *et al.*, 1988)

### **Ethnomedicinal Uses of *Cryptolepis* species**

Plants of the genus *Cryptolepis* have been known for their uses in traditional medicine of several countries. Ethnomedicinal uses of these plants are as follows.

The stem of *Cryptolepis buchanani* is used in Thai folk medicine. The alcoholic extract of the stem of this plant is commonly used for the treatment of inflammatory conditions such as arthritis muscle joint and backpain, strain and sprain of tendon and muscle. The leaves and seeds are used as remedies for neuralgic pain and dyspepsia, respectively. (ເລື່ອມພົມບູນຮອດ. 2519; ສາຍສນມ ກິຕິບັງ, 2526; Panthong *et al.*, 1986). The plant is also used in herbal mixtures for tendon, muscle and blood tonic and to normalize menstruation, as a treatment of headache and paresis (ວົງສົດສົດທີ່ ນິ້ວກຸດ ແລະຄະນະ, 2548)

In China, the root and fruits of *C. buchanani* are used for the treatment of fever and edema (Wu and Raven, 1995). In India, the plant is used in a preparation given to children to cure rickets. Decoctions of its stem are used by some rural people as a cure for paralysis. (Dutta, Sharma and Sharma, 1978). Its uses for the treatment of chronic rheumatism, dyspepsia, respiratory diseases dysuria, dysentery, leucorrhoea and uterine haemorrhage have also been reported (Khare, 2004).

The roots of *Cryptolepis sanguinolenta* is used in traditional Central and West African medicine to treat several infectious diseases. In Guinea Bissau the dried root, known as “Cuntesse”, is sold in the local market of Bandim and its decoction is used in the treatment of various fevers, hepatitis and jaundice. The leaves have been used in the treatment of malaria or powdered as a cicatrizant of wounds . In Ghana and Nigeria, the root has been used in the clinical therapy of malaria, rheumatism and urinary and upper respiratory tract infections. (Boye and Oku-Ampofo, 1990; Tackie *et al.*, 1993; Paulo, Duarte and Gomes, 1994; Paulo, Gomes and Houghton, 1995; Silva *et al.*, 1995; Olajide *et al.*, 2007).

The aqueous extracts of *C. obtusa* roots are used in Mozambique as an anti-abortive , vermifuge and to treat abdominal pains (Paulo *et al.*, 2000b).

### Biological Activities of *Cryptolepis* Species

Ethnopharmacological and chemical studies on *Cryptolepis* plants are as yet not advanced enough to ascertain whether their various folk medicinal uses are supported by the pharmacological activity of the constituents. Two *Cryptolepis* species have been investigated pharmacologically and the results exhibited interesting bioactivities of their components (extracts/isolated compounds).

The biological activities of extracts and isolated compounds from *Cryptolepis* species are summarized in Table 3.

**Table 3. Biological Activities of *Cryptolepis* Species**

Plants	Extract/Isolated compound	Activity	Reference

## CHAPTER III

## EXPERIMENTAL

## **Source of Plant Material**

The stem of *Cryptolepis buchanani* used in this study was collected from Phuvour wildlife sanctuary, Amphoe Bung Khla, Nongkhai province, Thailand on September 28, 2006. A voucher specimen no. 150913 was deposited in the herbarium of Royal Forest Department, Bangkok, Thailand.

## General Techniques

## **1. Chromatographic Technique**

### **1.1 Analytical Thin-Layer Chromatography (TLC)**

Technique	: One dimension, ascending
Stationary phase	: Silica gel 60 F <sub>254</sub> (E. Merck) precoated plate
Layer thickness	: 0.2 mm
Solvent system	: Various solvent systems depending on materials
Distance	: 5 cm
Temperature	: Laboratory temperature 30-35 °C
Detection	: 1) UV light at the wavelengths of 254 and 365 nm : 2) 10% sulfuric acid in ethanol, heating at 110 °C

## 1.2 Column Chromatography (CC)

Column	: Flat bottom glass column (various diameters)
Absorbent	: 1) Silica gel 60 (No. 7734, E. Merck) particle size 0.063-0.200 mm (70-230 mesh ASTM)  : 2) Silica gel 60 (No. 9385, E. Merck) particle size 0.040-0.063 mm (230-400 mesh ASTM)
Packing method	: Wet loading
Sample loading	: 1) Dry packing  The sample was dissolved in a small volume of organic solvent, mixed with a small quantity of adsorbent, triturated, dried and then loaded on the top of the column.

: 2) Wet loading

The sample was dissolved in a small amount of the eluent, then loaded on the top of the column.

Solvent system : Various solvent systems depending on materials

### **1.3 Gel Filtration Chromatography**

Stationary phase : Sephadex<sup>TM</sup> LH-20

Packing method : Gel filter was suspended in the eluent and left standing to swell for 24 hours prior to use. It was then poured into the column and allowed to set tightly.

Sample loading : The sample was dissolved in a small volume of the eluent and applied on top of the column.

Solvent system : Methanol 100 %

Methanol: Chloroform (1: 1)

### **1.4 Preparative Thin Layer Chromatography (PTLC)**

Stationary phase : Kieselgel 60 F<sub>254</sub>

Layer thickness : 1 mm.

Distance : 15 cm

Temperature : Laboratory temperature 30-35 °C

Detection : UV light at the wavelengths of 254 and 365 nm

Solvent : Hexane: Chloroform (3: 1)

## **2. Recrystallization Technique**

The compounds were recrystallized from their less soluble single solvents or mixtures. Each compound was dissolved completely in selected solvent until saturated and let standing at room temperature until amorphous powder or crystals were formed.

## **3. Spectroscopy**

### **3.1 Ultraviolet (UV) Absorption Spectra**

UV spectra (in chloroform and methanol) were obtained on a Shimadzu UV-160A spectrophotometer (Pharmaceutical Research Instrument Center, Faculty of Pharmaceutical Sciences, Chulalongkorn University)

### **3.2 Infrared (IR) Absorption Spectra**

IR spectra (KBr disc and thin film) were obtained on a Perkin Elmer Infrared Spectrophotometer Model 1760X (Scientific and Technological Research Equipment Center, Chulalongkorn University)

### **3.3 Mass Spectra (MS)**

Electrospray ionization Time of Flight (ESI-TOF) mass spectra were recorded on a Micromass LCT mass spectrometer (National Center for Genetic Engineering and Biotechnology, Thailand).

### **3.4 Proton and Carbon 13 Nuclear Magnetic Resonance ( $^1\text{H}$ and $^{13}\text{C}$ - NMR) Spectra**

The  $^1\text{H}$ -NMR (300 MHz) and  $^{13}\text{C}$ -NMR (75 MHz) spectra were obtained with a Bruker Avance DPX-300 FT-NMR spectrometer (Faculty of Pharmaceutical Sciences, Chulalongkorn University).

The  $^1\text{H}$ -NMR (500 MHz) and  $^{13}\text{C}$ -NMR (125 MHz) spectra were obtained with a JEOL JMN-A 500 spectrometer, Varian <sup>unity</sup>INOVA NMR spectrometer (Scientific and Technological Research Equipment Center, Chulalongkorn University) and Bruker-AV 500 MHz spectrometer (National Center for Genetic Engineering and Biotechnology, Thailand).

NMR solvents used in this study were deuterated chloroform ( $\text{CDCl}_3$ ) and deuterated acetone (acetone- $d_6$ ). Chemical shifts were reported in ppm scale using the chemical shift of the solvent as the reference signal.

## **4. Physical Properties**

### **4.1 Melting Points**

Melting points were obtained on a Fisher/Johns melting point apparatus (Department of Pharmaceutical Botany, Faculty of Pharmaceutical Sciences, Chulalongkorn University).

### **4.2 Optical Rotation**

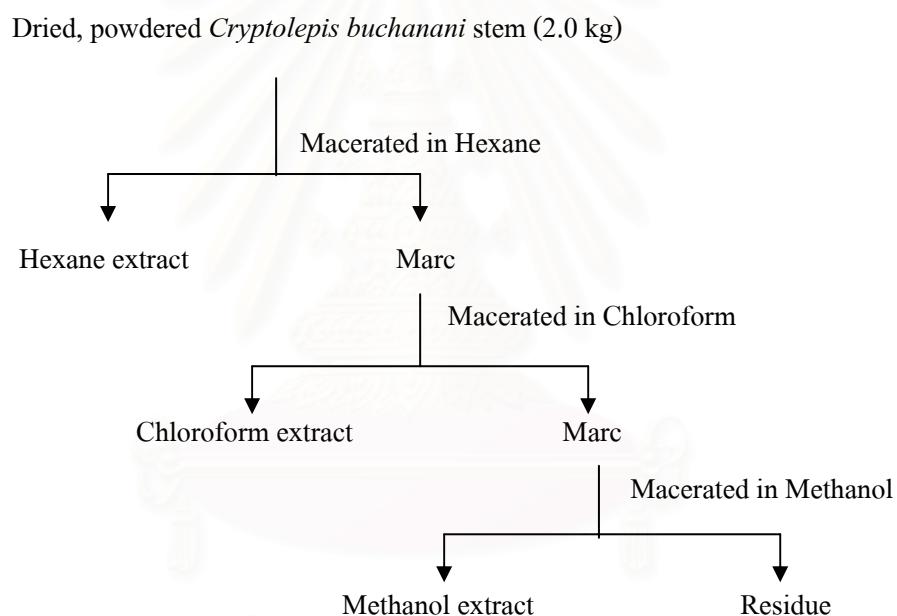

Optical rotation were measured on a Perkin-Elmer Polarimeter model 341 (Pharmaceutical Research Instrument Center, Faculty of Pharmaceutical Sciences, Chulalongkorn University).

## **5. Solvents**

Throughout this work, all organic solvents used in the extraction and isolation procedures were of commercial grade and were redistilled prior to use.

### Extraction

The dried, powdered stem of *Cryptolepis buchanani* (2.0 kg) was repeatedly macerated by with hexane (5 x 8L, 3 days each) at room temperature. Each combined hexane extract was filtered, evaporated under reduced pressure and to give the hexane extract 35.27 g: 1.76 % based on dried weight of the stem. The remaining marc was air-dried and consequently extracted with chloroform (5 x 8L, 3 days each) and methanol (5 x 8L, 3 days each) in the same manner to give, on evaporation, chloroform extract 23.59 g: 1.18 % based on dried weight of the stem and methanol extract 32.00 g: 1.60 % based on dried weight of the stem, respectively. These extracts were subjected to column chromatography for the further separation and purification.

**Scheme 1. Extraction of *Cryptolepis buchanani* stem.**

### Isolation

#### 1. The Hexane extract of *C. buchanani* stem.

The hexane extract (10.0 g) was subjected to a silica gel column (300 g, 10 × 20 cm) eluted with hexane-chloroform (3 : 1) to give 130 fractions of 30 ml each. The fractions were combined according to their TLC pattern into 10 major fractions (H01-H10), as shown in Table 4. Finally, the column was washed down with methanol to give fraction H11.

**Table 4. Combined fractions from the hexane extract**

Fraction	Number of eluates	Weight (g)
H01	1-13	0.62
H02	14-27	0.98
H03	28-37	0.64
H04	38-45	0.30
H05	46-53	0.27
H06	54-69	0.59
H07	70-83	0.55
H08	84-104	0.92
H09	105-114	0.47
H10	115-130	0.75
H11	methanol eluted	2.38

**1.1 Isolation of compound CB01**

Fraction H08 (0.92 g) was subjected to silica gel column chromatography (30 g, 2x30 cm) eluted with hexane-acetone (4:1) to give 87 fraction of 20 ml each. The fractions were combined according to their TLC pattern into 6 major fractions (H081-H086), as shown in Table 5. Finally, the column was washed down with methanol to give fraction H087.

**Table 5. Combined fractions from the fraction H08**

Fraction	Number of eluates	Weight (mg)
H081	1-7	32.5
H082	8-13	22.3
H083	14-25	57.9
H084	26-31	102.2
H085	32-43	115.7
H086	44-45	134.5
H087	methanol eluted	239.4

Fraction H085, which displayed one major pink-violet spot on TLC upon detection with 10% H<sub>2</sub>SO<sub>4</sub>, was recrystallized in methanol to give 104.2 mg (0.018 % yield) of component CB01 as colorless needles. The fractionation of hexane extract is summarized in Scheme 2.

## 2. The Chloroform extract of *C. buchanani* stem.

The chloroform extract (20 g) was subjected to silica gel column chromatography (600 g, 10x23.5 cm) eluted with chloroform-methanol mixture of increasing polarity (from 97:3 to 1:9) to give 230 fractions of 30 ml each. The fractions were combined according to their TLC pattern into 6 major fractions (C01-C06), as shown in Table 6. Finally, the column was washed down with methanol to give fraction C07.

**Table 6. Combined fractions from the chloroform extract**

Fraction	Number of eluates	Weight (g)
C01	1-32	1.03
C02	33-60	1.19
C03	61-109	3.15
C04	110-138	1.41
C05	139-189	3.77
C06	190-230	3.93
C07	methanol eluted	4.01

### 2.1 Isolation of Compound C02

Fraction C02 (1.19 g) was subjected to silica gel column chromatography (40 g, 5x40 cm) eluted with hexane-chloroform (3:2) to give 45 fractions of 20 ml each. The fractions were combined from their TLC pattern into 6 major fractions, as shown in Table 8. The column was then washed down with methanol to give fraction C027.

**Table 7. Combined fractions from the fraction C02**

Fraction	Number of eluates	Weight (mg)
C021	1-9	66.1
C022	10-14	76.2
C023	15-21	85.4

**Table 7. Combined fractions from the fraction C02**

Fraction	Number of eluates	Weight (mg)
C024	22-29	161.7
C025	30-36	104.1
C026	37-45	213.7
C027	methanol eluted	398.7

Fraction C023 (85.4 mg) displayed one major yellow-orange spot on TLC plate detection under UV light. It was further purified on a Sephadex LH 20 column (1x80 cm), using methanol as the eluent to give 11.9 mg (0.00070 % yield) of compound CB02 as yellow-orange crystals.

## 2.2 Isolation of compounds CB03 and CB04

Fraction C05 (3.77 g) was further chromatographed on a silica gel column (120 g, 5x40 cm) eluted with chloroform-ethyl acetate (9:1) to give 130 fractions of 30 ml each. The fractions were then combined into 5 major fractions (C051-C055), as shown in Table 7.

**Table 8. Combined fractions from the fraction C05**

Fraction	Number of eluates	Weight (g)
C051	1-48	0.77
C052	49-64	0.75
C053	65-79	0.53
C054	80-101	0.64
C055	102-130	0.91

Fraction C054 (0.64 g) showed interesting spots on TLC. It was subjected to Sephadex LH-20 gel filtration (2x120 cm) using methanol as the eluent. Twenty five fractions (5 ml each) were collected and monitored by silica gel TLC with chloroform-ethyl acetate (9:1) as the mobile phase. Those fraction of similar TLC pattern were combined into 3 major ones, as shown in Table 9.

**Table 9. Combined fractions from the fraction C054**

Fraction	Number of elutes	Weight (mg)
C0541	1-9	185.27
C0542	10-18	103.11
C0543	19-25	311.20

Fraction C0542 (103.11 mg) displayed two major spots ( $R_f = 0.40$  and  $0.38$ ) on TLC plates when detected under UV light. The two major bands were separate by preparative TLC, using hexane-acetone (3:1) as the solvent to give 13.0 mg (0.00076 % yield) and 16.0 mg (0.00094 % yield) of compound CB03 and CB04, respectively.

### 2.3 Isolation of compounds CB05 and CB06

Fraction CB053 (0.53 g), was subjected to silica gel column chromatography (20 g, 2x30 cm) eluted with hexane-acetone (3:1) to give 60 fractions of 20 ml each. The fractions were combined according to their similar TLC patterns into 4 major fractions (CB0531-CB0534), as shown in Table 10.

**Table 10. Combined fractions from the fraction C053**

Fraction	Number of elutes	Weight (mg)
C0531	1-13	97.3
C0532	14-28	66.4
C0533	19-47	67.8
C0534	48-60	185.2

Fraction CB0533 (0.53 g) displaying two major spots on TLC plate when detected under UV light. It was further separated by Sephadex LH 20 column (2x60 cm), using methanol as the eluent to give 6.5 mg (0.00038 % yield) of compound CB05 as pale yellow needles and 12.7 mg (0.00074 % yield) of compound CB06 as yellow needles.

The fractionation of hexane extract is summarized in Scheme 3.

### Characterization of isolated compounds

#### 1. Component CB01

Appearance : colorless needles  
 Solubility : Soluble in chloroform, hexane  
 $^1\text{H-NMR}$  ( $\delta$  ppm, 300 MHz,  $\text{CDCl}_3$ ) :

Scheme 2. Isolation of the hexane extract from *Cryptolepis buchanani* stem

**Scheme 3.** Isolation of the chloroform extract from *Cryptolepis buchanani* stem

## CHAPTER IV

### RESULTS AND DISCUSSION

Investigation of the hexane and chloroform extracts of *Cryptolepis buchanani* stem led to the isolation of compounds CB01, CB02, CB03, CB04, CB05, and CB06. The identification and structure elucidation of the isolated compounds were done by analysis of the spectroscopic data (UV, IR, MS and NMR), as well as comparison with the data of related compounds. The details are as follows.

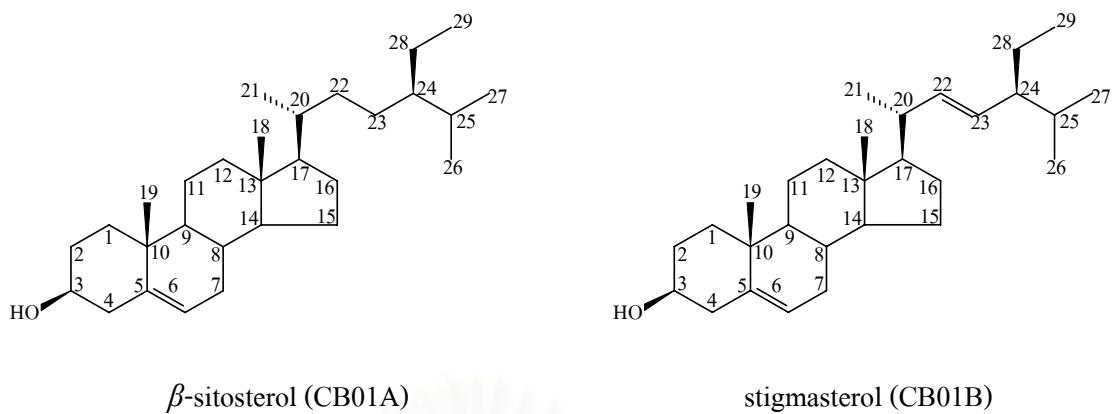

#### 1. Structure identification of compound CB01

Compound CB01 was obtained as colorless needles (104.2 mg, 0.018 % yield). It gave purple color upon spraying with 10 % H<sub>2</sub>SO<sub>4</sub> in ethanol and heated. Liebermann-Burchard test of this compound gave positive green color, suggesting the presence of a steroid skeleton.

The <sup>1</sup>H-NMR spectrum (Figure 4) gave evidences which suggested that CB06 is a mixture of  $\beta$ -sitosterol and stigmasterol. The signal at  $\delta$  5.33 ppm (1H, d,  $J= 4.5$  Hz) was assignable to H-6 of both  $\beta$ -sitosterol and stigmasterol , while two signal at  $\delta$  5.09 and 5.00 ppm were assignable to olefinic proton at H-22 and H-23 of stigmasterol, respectively. A multiplet at  $\delta$  3.50 ppm was assigned as methine proton of hydroxyl-substituted position 3 of both  $\beta$ -sitosterol and stigmasterol. The ratio of CB01A ( $\beta$ -sitosterol) and CB01B (stigmasterol) in the mixture was deduced from the integration value between H-6 and H-22 or H-23 to be 4:1:1

The <sup>13</sup>C NMR spectrum (Figure 5-6) and DEPT experiment (Figure 7) showed signals of 29 carbons. The signals of  $\beta$ -sitosterol were more prominent than those of stigmasterol. However, four olefinic carbon signals could be observed at  $\delta$  140.7, 138.2, 129.3 and 121.7 ppm. The two signals at  $\delta$  138.2 and 129.3 ppm were assignable to C-22 and C-23 of stigmasterol, whereas the other two signal at  $\delta$  140.7 and 121.7 ppm were assignable to C-5 and C-6 of both  $\beta$ -sitosterol and stigmasterol, respectively.

Therefore, it was concluded that CB01 is a mixture (4:1) of  $\beta$ -sitosterol and stigmasterol. These two steroids are common phytosterols widely distributed in the plant kingdom. Comparison of <sup>13</sup>C NMR spectral data of CB01A and CB01B with reported data of  $\beta$ -sitosterol and stigmasterol (De-Eknamkul and Potduang, 2003), is shown in Table 16.

**Table 11. Comparison of  $^{13}\text{C}$  NMR spectral data of  $\beta$ -sitosterol, stigmasterol and compound CB01 (a mixture of CB01A and CB01B) (in  $\text{CDCl}_3$ , 75 MHz)**

## 2. Structure identification of compound CB02

Compound CB02 was obtained as yellow-orange needles (11.9 mg, 0.00070 % yield). This compound displayed yellow-orange color under UV light, suggesting the present of a highly conjugated chromophore structure. Its molecular formula was determined as C<sub>14</sub>H<sub>8</sub>O<sub>4</sub> from HR ESI TOF mass spectrum (Figure 10), with its [M+H]<sup>+</sup> peak at *m/z* 241. The presence of only eight carbon signals in its <sup>13</sup>C NMR spectrum (Figure 12) could be due to the result of some equivalent and superimposition of signals. The IR absorption bands (Figure 9) suggested the presence of hydroxyl group (3434 cm<sup>-1</sup>), carbonyl group (1626 cm<sup>-1</sup>) and aromatic ring (1602, 1577 and 1470 cm<sup>-1</sup>).

The <sup>1</sup>H-NMR spectrum (Figure 11) showed a signal of chelated phenolic hydroxyl groups at  $\delta$  12.05 ppm (1-OH and 8-OH, 1H, *s*). The spectrum indicated the present of three typical aromatic proton signals frequently recognized in quinones at  $\delta$  7.29 ppm (1H, *dd*, *J*=8.5, 1.0 Hz), 7.67 (1H, *t*, *J*=8.0 Hz) and 7.82 ppm (1H, *dd*, *J*=7.5, 1.0 Hz), which could be assigned to H-2 and H-7, H-3 and H-6 and H-4 and H-5 of a symmetrical anthraquinone structure, respectively.

The DEPT (Figure 13) experiments were performed to differentiate these signals into six methine carbons at  $\delta$  124.6 (C-2, C-7), 137.3 (C-3, C-6) and 120.0 ppm (C-4, C-5), and six quaternary carbons at  $\delta$  162.5 (C-1, C-8), 133.6 (C-4a, C-5a) and 115.8 (C-1a, C-8a), and two quinone carbonyl signal at  $\delta$  193.1 (C-9) and 182.7 ppm (C-10).

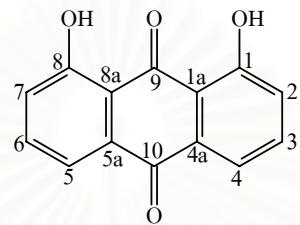

HMBC experiment exhibited long-range correlations from the hydroxy proton signal at  $\delta$  12.05 ppm to C-1, C-8 ( $\delta$  162.5 ppm), suggesting the presence of hydroxy group at C-1 and C-8. The three signals of methine proton at  $\delta$  7.29, 7.67 and 6.89 ppm were assigned to H-2 and H-7, H-3 and H-6 and H-4 and H-5, respectively, and confirmed by the HMBC correlations as shown in Table 14.

Thus, this compound was identified as 1,8-dihydroxy-9,10-anthracenedione or danthron from these spectroscopic data and comparison with literature (Khalafy and Bruce, 2002). This is the first report of its occurrence in the genus *Cryptolepis*.

Danthron had been widely used as a laxative, but was later found to be carcinogenic in human (Ausra *et al.*, 2002; Hui *et al.*, 2005; Mueller *et al.*, 1996; Van-Gorkom *et al.*, 2002). It is the precursor for the topical antipsoriatic drug anthralin or 1,8-dihydroxy 9-anthrone (Ashton *et al.*, 1983; Kemeny, Ruzicka and Braun-Falco, 1990). Danthron has been shown to possess various

biological activities, such as antifungal (Chi-Hoon and Hoi-Seon, 2005), antioxidant and radical scavenging activities (Malterud *et al.*, 1993).

Anthraquinones are distributed fairly widely in moulds especially in *Aspergillus* and *Penicillium spp.* They are uncommon in higher fungi but are found more frequently in lichens. Therefore, danthon found in this study might originated from lichens on the surface of *C. buchanani* stem.

Danthon (Compound CB02)

### 3. Structure elucidation of compound CB03

Compound CB03 was obtained as colorless needles (13.0 mg, 0.00076 % yield). It gave purple color upon spraying with 10 % H<sub>2</sub>SO<sub>4</sub> in ethanol and heated. Liebermann-Burchard test of this compound gave green color, suggesting the presence of a steroid skeleton. Its molecular formula was determined as C<sub>21</sub>H<sub>30</sub>O<sub>4</sub> from ESI TOF mass spectrum (Figure 19), with its [M+Na]<sup>+</sup> peak at *m/z* 369. The IR spectrum (Figure 18) suggested the presence of hydroxyl group at 3475 cm<sup>-1</sup>, carbonyl and conjugated carbonyl groups at 1694 and 1661 cm<sup>-1</sup>, which the absorption band at 1609 cm<sup>-1</sup> was due to stretching vibration of the olefinic bond.

The <sup>1</sup>H-NMR spectrum (Figure 20) showed two methyl singlet signals at  $\delta$  0.67 (H-18) and 1.33 ppm (H-19). Six methine protons resonated at  $\delta$  1.66 (H-8), 1.05 (H-9), 1.24 (H-14), 2.63 (H-17). The doublet at  $\delta$  5.70 ppm could be assigned to the olefinic proton H-4. An oxymethine proton resonated at  $\delta$  4.21 ppm (H-2), while oxymethylene protons appeared at  $\delta$  4.15 ppm (H-21). The signal between  $\delta$  1.20-2.40 ppm were the signals of methylene protons at  $\delta$  1.51 (H-1 $\alpha$  and 2.27 (H-1 $\beta$ ), 2.32 (H-6 $\alpha$  and 2.46 (H-6 $\beta$ ), 1.08 (H-7 $\alpha$ ) and 1.88 (H-7 $\beta$ ), 1.48 (H-11 $\alpha$ ) and 1.65 (H-11 $\beta$ ), 1.45 (H-12 $\alpha$  and 1.95 (H-12 $\beta$ ), 1.30 (H-15 $\alpha$ ) and 1.75 (H-15 $\beta$ ), 1.73 (H-16 $\alpha$ ) and 2.18 (H-16 $\beta$ ) ppm. Two hydroxyl proton signals appeared as split into doublets (*J*= 3 Hz) and triplets (*J*= 5 Hz) due to the neighboring methine proton at  $\delta$  3.92 ppm (2-OH) and methylene protons at  $\delta$  3.68 ppm (21-OH), respectively.

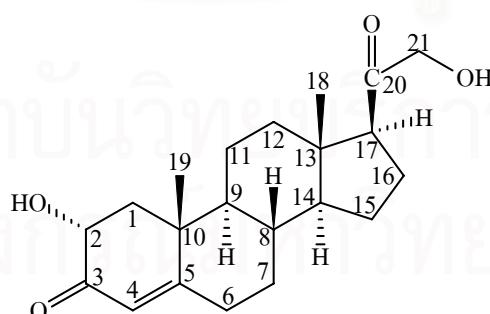

The <sup>13</sup>C NMR spectrum (Figure 21) showed the signals of 21 carbon atoms, supporting the assignment of this compound as a pregnane steroid. The DEPT 90 and 135 (Figure 22) experiments were performed to differentiate these signals into those of two methyl carbons at  $\delta$  13.7 (C-18) and 18.2 ppm (C-19), eight methylene carbons at  $\delta$  45.3 (C-1), 32.9 (C-6), 32.7 (C-7), 21.5 (C-11), 38.9 (C-12) 24.9 (C-15), 23.4 (C-16) and 69.9 ppm (C-21). Six methine carbons resonated at  $\delta$  35.7 (C-8), 55.1 (C-9), 56.6 (C-14) and 59.1 (C-17) In addition, two distinct downfield methine signals assignable to oxygenated and olefinic carbons at  $\delta$  70.0 (C-2) and 121.2 (C-4) ppm, respectively.  $\alpha$ ,  $\beta$ -unsaturation causes an olefinic signal to shift downfield to  $\delta$  172.4 (C-5), which two carbonyl signals at  $\delta$  200.0 (C-3) and 210.9 (C-20) ppm were assignable to keto carbonyl moieties.

The <sup>1</sup>H-<sup>1</sup>H COSY (Figure 23) and HMBC experiment (Figures 27-30, Table 13) assisted in the elucidation of the chemical structure of compound CB03. Two hydroxyl groups which resonated at  $\delta$  3.92 and 3.68 ppm should be placed at C-2 and C-21 as confirmed by the HMBC correlations with C-2 and C-21, respectively. The proton signal of H-2 at  $\delta$  4.21 ppm and 2-OH

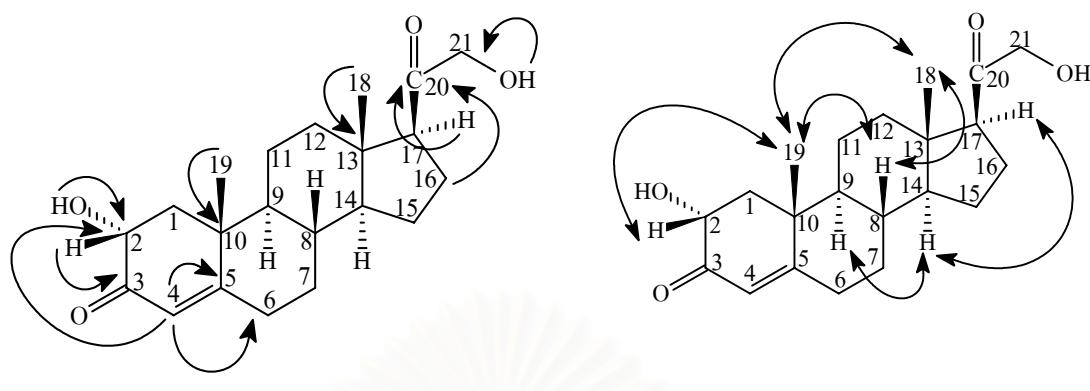

exhibited correlations with C-3 ( $\delta$  200.0 ppm), whereas the signals at  $\delta$  2.63 (H-17),  $\delta$  2.18 (H-16) and 21-OH ppm exhibited correlations with C-20, confirming the positions of keto carbonyl at C-3 and C-20, respectively. The signal of the olefinic H-4 ( $\delta$  5.70 ppm) showed two-bond correlations with C-5 and three-bond correlation with C-2, C-6 and C-10, confirming the position of double bond between C-4 and C-5.

The stereochemistry of the structure was determined basic on its NOESY (Figure 31). Correlations between H-2 and H-19, H-8 and H-19, H-8 and H-18 and H-18 and H-19 showed that they were in the same orientation. According to the literature, pregnanes have previously been isolated from several plants of the family Asclepiadaceae (Table 1. and Figure 2.) supporting that the 18, 19 methyl protons were both  $\beta$ -oriented and, therefore, H-2 and H-8 were  $\beta$ -oriented too. Hence, 2-OH, H-9, H-14 and H-17 which showed no NOESY with the former group must be  $\alpha$ -oriented and revealed that the ketone at C-17 should be  $\beta$ -oriented.

Elucidation of CB03 structure was also done by comparison of the  $^1\text{H}$  and  $^{13}\text{C}$  -NMR data of this compound with the previously reported of the  $^1\text{H}$ -NMR data 2 $\beta$ -hydroxycortexone (Laskin *et al.*, 1965) and  $^{13}\text{C}$  -NMR data of deoxycorticosterone (Hunter and Carragher, 2003). Compound CB03 was identified as a 2 $\alpha$ , 21-dihydroxypregn-4-ene-3, 20-dione. Although this Compound has been previously obtained from semi-synthesis (Christain *et al.*, 1989) and synthesis (Hill, 1991), this is the frist time it has been found in a naturally occurring compound. Comparison of their  $^1\text{H}$  and  $^{13}\text{C}$ -NMR data is presented in Table 13.

#### 4. Structure elucidation of compound CB04

Compound CB04 was obtained as colorless needles (16.0 mg, 0.00094 % yield). It gave purple color upon spraying with 10 % H<sub>2</sub>SO<sub>4</sub> in ethanol and heated. Liebermann-Burchard test of this compound gave green color, suggesting the presence of a steroid skeleton. Its molecular formula was determined as C<sub>21</sub>H<sub>28</sub>O<sub>4</sub> from ESI TOF mass spectrum (Figure 34), with its [M+Na]<sup>+</sup> peak at *m/z* 367. The IR spectrum (Figure 33) suggested the presence of hydroxyl group at 3468 cm<sup>-1</sup>, carbonyl and conjugated carbonyl group at 1696 and 1650 cm<sup>-1</sup>, the absorption band at 1578 cm<sup>-1</sup> was due to stretching vibration of the olefinic bond.

Comparison of <sup>1</sup>H and <sup>13</sup>C-NMR data of compounds CB04 and CB03 indicated that they are similar, except compound CB04 contains an additional double bond.

The <sup>1</sup>H-NMR spectrum (Figure 35) showed two singlet signals of methyl group at δ 0.72 (H-18) and 1.23 ppm (H-19). The signals at δ 5.69, 6.23 and 6.18 ppm which could be assigned as olefinic proton H-4, H-6 and H-7, respectively. An oxymethine proton was observed at δ 4.36 ppm, while oxymethylene proton appeared at δ 4.17 ppm. Two hydroxyl proton signals appeared as split into doublets (*J*= 5 Hz) and triplets (*J*= 5 Hz) due to the neighboring methine proton at δ 3.97 ppm (2-OH) and methylene protons at δ 3.69 ppm (21-OH), respectively.

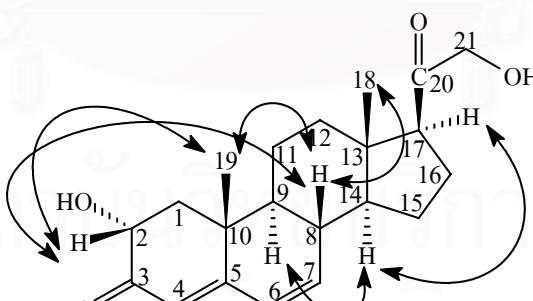

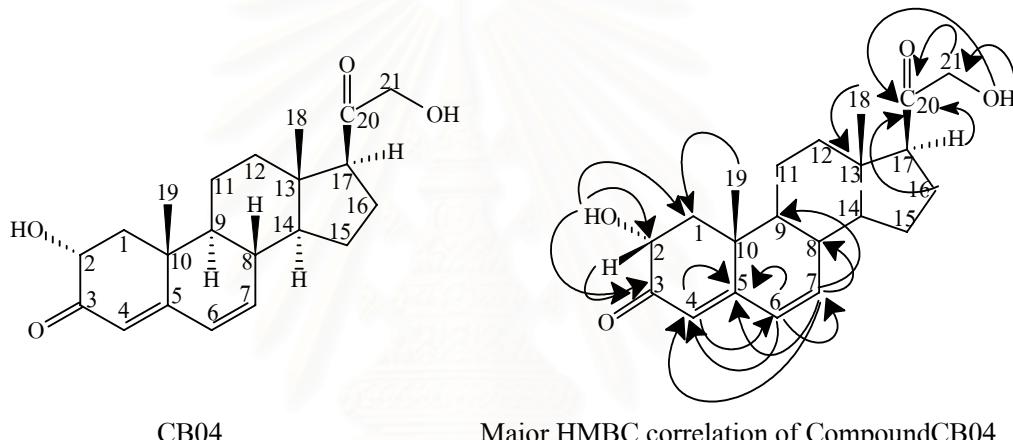

The <sup>13</sup>C NMR spectrum (Figure 36) showed the signals of 21 carbon atoms, supporting the assignment of this compound as pregnane steroid. The DEPT (Figure 37) and HSQC (Figures 40-41) experiments were performed to differentiate these signals into two methyl carbon at δ 17.3 (C-19) and 13.6 (C-18) ppm, Two carbonyl carbon signals appeared at δ 199.9 (C-3) and δ 210.8 (C-20) ppm and four olefinic carbons resonances were located at δ 121.8 (C-4), 165.0 (C-5), 128.2 (C-6) and 141.7 (C-7) ppm. Two signal for oxygenated carbon were observed at δ 70.3 (C-2) and 69.9 (C-21) ppm

The <sup>1</sup>H-<sup>1</sup>H COSY (Figures 38-39) and HMBC experiment (Figures 43-46, Table 14) assisted in the elucidation of the chemical structure of compound CB04. Two hydroxyl signals at δ 3.97 and 3.69 ppm should be placed at C-2 and C-21 as confirmed by the HMBC correlations with C-2 and C-21, respectively. The proton signal at δ 4.21 (H-2) ppm exhibited correlation with C-3 (δ 199.9 ppm), whereas the signals at δ 2.7 (H-17) and δ 2.23 (H-16) ppm exhibited correlation with C-20, confirming position of keto carbonyl at C-3 and C-20, respectively. The signal of the olefinic H-6 (δ 6.23 ppm) showed two-bond correlation with C-5 and three-bond correlation with C-4 and C-8, and H-7 (δ 6.18 ppm) showed two-bond correlation with C-8 and

three-bond correlation with C-5, C-9 and C-14, confirming the position double bond between C-6 and C-7.

Compound CB04 showed similar NOESY correlations to those of compound CB03, (Figure 47), suggesting that H-2, H-8, H-18 and H-19 were in  $\beta$ -oriented, whereas H-9, H-14 and H-17 were in  $\alpha$ -oriented.

Therefore, the elucidation of the structure of CB04 was mainly accomplished by comparison of the  $^1\text{H}$ -NMR and  $^{13}\text{C}$ -NMR chemical shift data with CB03 (Table 13). Based on above spectral evidence, compound CB04 was identified as a new naturally occurring pregnane steroid,  $2\alpha, 21$ -dihydroxypregn-4,6-diene-3,20-dione.  $^1\text{H}$  and  $^{13}\text{C}$ -NMR data of compound CB04 is presented in Table 14.

## 5. Structure elucidation of compound CB05

Compound CB05 was obtained as pale-yellow needles (6.5 mg, 0.00038 % yield). It gave purple color upon the spraying with 10 % H<sub>2</sub>SO<sub>4</sub> in ethanol and heated. Liebermann-Burchard test of this compound gave green color, suggesting the presence of a steroid skeleton. Its molecular formula was determined as C<sub>21</sub>H<sub>26</sub>O<sub>4</sub> from HR ESI TOF mass spectrum (Figure 50), with its [M+Na]<sup>+</sup> peak at *m/z* 365. The IR spectrum (Figure 49) suggested the presence of hydroxyl group at 3444 cm<sup>-1</sup>, carbonyl and conjugated carbonyl group at 1715, 1631, 1615 cm<sup>-1</sup>.

Comparison of <sup>1</sup>H and <sup>13</sup>C-NMR data of compound CB05 which those of compound CB04 indicated that compound CB05 had a distinct similarity to compound CB04, excepted only the structure of compound CB05 contain an additional double bond.

The <sup>1</sup>H-NMR spectrum (Figure 51) showed two singlet signals of methyl group at  $\delta$  0.77 (H-18) and 1.25 ppm (H-19). The signals at  $\delta$  6.27, 6.13, 6.30 and 6.09 ppm could be assigned to the olefinic proton H-1, H-4, H-6 and H-7. An oxymethylene resonated at  $\delta$  4.20 ppm. Hydroxy group on ring A showed signal at  $\delta$  6.44 ppm, which downfield than compound CB03 and CB04 because its was attributable to the olefinic carbon at C-2.

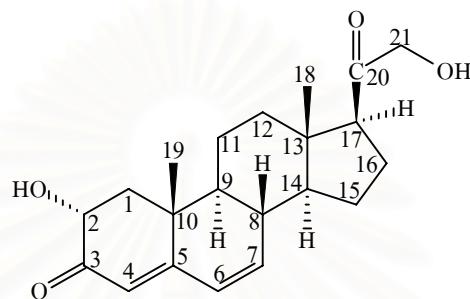

The <sup>13</sup>C NMR spectrum (Figure 52) showed the signals of 21 carbon atoms, supporting to assignment of this compound as pregnane steroid. The DEPT 90 and 135 (Figure 53) and HMQC (Figures 55-56) experiments were performed to differentiate these signals into two methyl carbon at  $\delta$  21.7 (C-19) and 13.5 (C-18) ppm, Two carbonyl carbon signals appeared at  $\delta$  181.4 (C-3) and  $\delta$  209.9 (C-20) ppm and six olefinic carbons resonances were located at  $\delta$  120.8 (C-1), 146.7 (C-2), 121.2 (C-4), 165.7 (C-5), 127.7 (C-6) and 138.7 (C-7) ppm. A signal for one carbon-bearing oxygen was observed at  $\delta$  69.5 (C-21) ppm.

The <sup>1</sup>H-<sup>1</sup>H COSY (Figure 54) and HMBC experiment (Figure 55-59, Table 15) assisted in the elucidation of the chemical structure of compound CB05. Ketone carbonyls could be assigned to C-3 and C-20 of which according to HMBC correlations of OH-( $\delta$  6.44 ppm) and methine H-17 ( $\delta$  2.52 ppm) and oxymethylene H-21 ( $\delta$  4.20 ppm) to these carbon resonance at 181.4 (C-3) and 209.9 (C-20) ppm, respectively. The signal of olefinic H-1 ( $\delta$  6.27 ppm) showed two-bond correlations with C-2 and C-10 and three bond correlation with C-C-3, C-5, C-9 and C-19, confirming the position of double bond between C-1 and C-2. Cross peak between the signals of both 2-OH and C-2, established the position of hydroxyl substitutions at C-2.

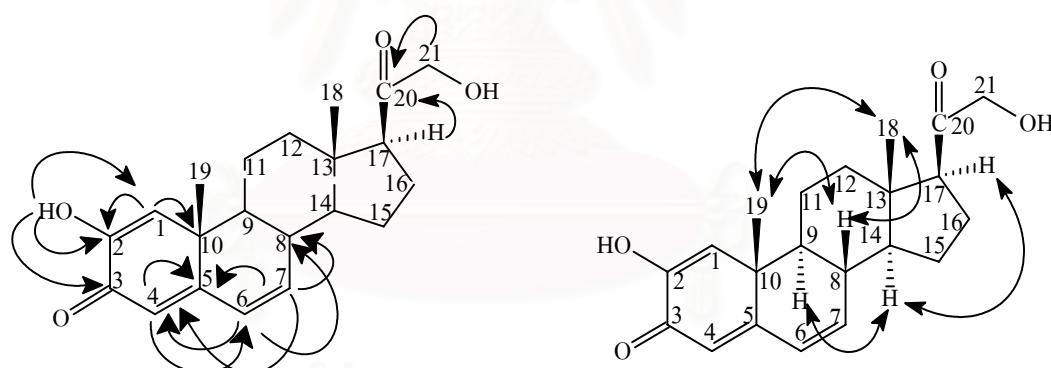

Compound CB05 showed similar NOESY correlations to those of compound CB03 and CB04 (Figure 60), suggested that H-8, H-18 and H-19 were in  $\beta$ -orientated, H-9, H-14 and

H-17 were in  $\alpha$ -oriented.

The elucidation of the structure of CB05 was mainly accomplished by comparison of the  $^1\text{H-NMR}$  and  $^{13}\text{C-NMR}$  chemical shift data with CB04 (Table 14). Based on above spectral evidence, compound CB05 was identified as a new naturally occurring pregnane steroid, 2,21dihydroxypregn-1,4,6-triene-3,20-dione.  $^1\text{H}$  and  $^{13}\text{C-NMR}$  data of compound CB05 is presented in Table 15.

## 6. Structure identification of compound CB06

Compound CB06 was obtained as yellow needles (12.7 mg, 0.00074 % yield). This compound fluoresced under UV light, suggesting that it might be a coumarin. Its molecular formula was determined as  $C_{10}H_8O_4$  according to its ESI TOF mass spectrum (Figure 63), with its  $[M+H]^+$  peak at  $m/z$  193. The IR absorption peaks (Figure 62) suggested the presence of hydroxyl group ( $3337\text{ cm}^{-1}$ ), carbonyl group ( $1703\text{ cm}^{-1}$ ) and aromatic ring ( $1608$ ,  $1566$  and  $1509\text{ cm}^{-1}$ )

The  $^1\text{H-NMR}$  spectrum (Figure 64) showed two coupled doublets signals at  $\delta$  6.24 and 7.57 ppm (1H each,  $d$ ,  $J=9.5$  Hz) which could be assigned to H-3 and H-4 of a coumarin skeleton, respectively. The 6, 7-disubstituted aromatic ring was suggested by two singlets at  $\delta$  6.82 and 6.89 ppm (1H each,  $s$ ) assignable to H-5 and H-8, respectively. The presence of a singlet at  $\delta$  3.93 ppm integrated for three protons represents one methoxy substituent.

The  $^{13}\text{C NMR}$  spectrum (Figure 65) showed the signals of 10 carbon atoms. The DEPT (Figure 66) and HSQC (Figure 68-69) experiments differentiated these signals into those of one methoxy carbon at  $\delta$  56.4 ppm, four methine carbons at  $\delta$  113.4 (C-3), 143.3 (C-4), 107.5 (C-5) and 103.2 ppm (C-8), four quaternary carbons at  $\delta$  111.5 (C-4a), 144.0 (C-6), 149.7 (C-7) and 150.2 ppm (C-8a), and the most downfield quaternary signal at  $\delta$  161.4 ppm was assignable to carbonyl moiety at C-2.

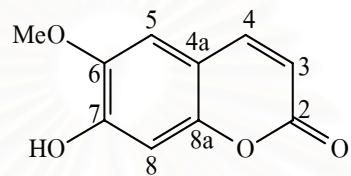

HMBC experiment (Figures 70-72) exhibited long-range correlation between the methoxy proton at  $\delta$  3.93 ppm and C-6 ( $\delta$  144.0 ppm), suggesting the presence of methoxy group at C-6. The NOESY experiment (Figure 73) showed cross peaks between H-5 and both H-4 and  $6-\text{OCH}_3$ , confirming the position of the methoxy group.

From all of the above spectroscopic data and comparison with previously published data (Tsukamoto *et al.*, 1985; Sibanda *et al.*, 1989), compound CB06 was identified as a 7-hydroxyl 6-methoxycoumarin named scopoletin.

Scopoletin has previously been isolated from several plants of the family Rutaceae e.g. from *Haphophyllum vulcanifolium* bark (Chang *et al.*, 1997), *H. obtusifolium* (Gashimov and Kuznetsova, 1975), *Pelea anisata* fruits (Elpern and Mitchell, 1984), *Murraya paniculata* foliage (Steck, 1972), *Clausena anisata* (Ojewole *et al.*, 2002), and also from other plants families such as from *Olea africana* bark (Oleaceae) (Tsukamoto *et al.*, 1984), *Coptis trifolia* whole plants (Ranunculaceae) (Mizuno *et al.*, 1992), *Sonchus gomerensis* (Compositae) (Mansour, Saleh and Boulos, 1983), *Pelargonium sidoides* roots (Geraniaceae) (Kayser and Kolodziej, 1995), *Impatiens balsamina* roots (Balsaminaceae) (Panichayupakaranant *et al.*, 1995), *Diospyros*

*hirsuta* bark (Ebenaceae) (Herath *et al.*, 1978), *Bupleurum fruticosum* roots (Apiaceae) (Pistelli *et al.*, 1996) and *Magonia glabrata* fruit bark (Sapindaceae) (Lemos *et al.*, 2006)

Scopoletin has been shown to possess various biological activities, for examples, antifungal (Valle *et al.*, 1997), hepatoprotective (Mohamed *et al.*, 2005), antioxidant (Shaw *et al.*, 2003), antiproliferative (Liu *et al.*, 2001), antitumor (Cassady *et al.*, 1979), immunomodulatory (Manuele *et al.*, 2006) and anti-inflammatory action against the release of PGE<sub>2</sub>, TNF- $\alpha$ , IL-I $\beta$ , IL-6 and suppression of cox-2 expression (Kim *et al.*, 2004).

Scopoletin (Compound CB06)

## CHAPTER V

### CONCLUSION

Three pregnane steroids, an anthraquinone, a coumarin, and a mixture of two phytosterols were isolated from the stem of *Cryptolepis buchanani* Roem & Schult (Asclepidaceae). Their chemical structures were determined using spectroscopic techniques. Three of them were identified as new naturally occurring pregnanes named  $2\alpha,21$ -dihydroxypregn-4-ene-3,20-dione,  $2\alpha,21$ -dihydroxypregn-4,6-diene-3,20-dione and  $2,21$ -dihydroxypregn-1,4,6-triene-3,20-dione. The remainder was the known coumarin, scopoletin, the anthraquinone, danthon and a mixture (4:1) of  $\beta$ -sitosterol and stigmasterol.

The structures of pregnane steroids isolated from *C. buchanani* are closely related to biologically active steroid hormones, especially glucocorticoids which possessed significant in anti-inflammatory activities. It is possible that these compounds should possess anti-inflammatory activities as well. It may be harmonized with Thai folk medicinal usages, such as arthritis, muscle and joint pain. Furthermore the results obtained could be valuable information for future phytochemical studies of this plants as well as chemotaxonomy of the Asclepiadaceae, Tribe and Genus levels.

**VITA**

Miss Amornthip Somsook was born on May 16, 1978 in Songkhla, Thailand. She received her Bachelor degree in Pharmaceutical Sciences in 2002 from the Faculty of Pharmaceutical Sciences, Prince of Songkla University, Hatyai, Thailand. She is now working as a hospital pharmacist at Satun hospital, Satun, Thailand.
