APPENDICES

APPENDIX A

Technical Description of Automated Clinical Analyzer.

Technical Description of Automated Clinical Analyzer.

Automated Clinical Analyzer was conceived and specifically developed for high-quality chemistry testing in physician offices and in small laboratories and laboratory unit in hospital and reference laboratory settings. A primary objective of the system is to test whole blood samples from a capability tube or vein-puncture tube. No serum or plasma separation is required. Automated Clinical Analyzer is a fully automated and computer controlled instrument designed for the in-vitro diagnostic quantitation of biological fluid component and therapeutic drugs as well as the qualitative determination of drugs of abuse in urine. Automatically calibrate every test channel, sample identification, data analysis, reporting the result and problem identification of the patient's sample blood test. This laboratory equipment controlled by computer was first invented by Du Pont in 1970.

With an on-board capacity of 60 - 120 refrigerated reagents, this equipment provides immediate random-access to an on-line menu of up to 100 chemistries and can perform tests at 1,050 - 1,060 test per hour. This equipment runs photometry test on blood samples with any of the available test packs. This system has a walk away capacity of 150 samples and can add more any time without interrupting analysis. The five position sample rack holders either primary tubes or sample cups. Samples are bar-coded to prevent errors in patient identification. Sample racks are also coded for recognition by the system. This allows the operator to insert a quality control rack any time, which then runs without further intervention. After a sample is inserted into the test pack, the pack is placed into the integral centrifuge where the barcode is identifying the nature of the test to be performed. The operator rarely has to push more than the run button to initiate the test.

Advanced robotics permit aspiration directly from primary sample tubes. Samples are fed automatically into the system on a linear track conveyor. Pipetting arms fitted with liquid level sensors alert the operator to sample shortage, and also detect fibrin in the sample. Automated Clinical Analyzer requires test menu such as routine (blood) chemistries, electrolytes, urine chemistries, drugs of abuse, therapeutic drug monitoring, serum proteins, thyroid function, lipid profile.

APPENDIX B

Number of Tests in Public Hospital and Clinical Laboratory

Table B.1 Number of Tests in Public Hospital, October 1998 to September 1999.

Type of test	1998						1999						Total
	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	
Blood glucose	2510	2613	2551	1883	2544	3030	2939	3079	2961	2892	2951	3060	33,013
Cholesterol	440	578	543	415	480	609	570	542	554	602	579	580	6,492
Triglyceride	281	324	422	296	398	475	429	440	359	496	483	462	4,865
HDL	110	142	202	122	186	206	162	111	131	124	153	139	1,788
BUN Creatinine	1139	1260	1281	978	1205	1479	1288	1329	1420	1346	1214	1269	15,208
Uric Acid	551	766	705	474	621	781	660	698	868	774	659	71	7,628
Total Bilirubin	314	371	412	310	389	497	465	417	451	370	353	364	4,713

BIOGRAPHY

1. Name : Tri Juni Angkasawati
2. Sex : Female
3. Date of Birth : 11 June 1965
4. Marriage Status : Married
5. Nationality : Indonesia
6. Education Qualification : Faculty of Medicine
Airlangga University
Surabaya, East Java, Indonesia
1985 – 1991
Medical Doctor
7. Designation : Junior Researcher of Health Services Research and Development Center, Surabaya
8. Address : Jl. Indrapura No. 17
Surabaya 60176
East Java, Indonesia
Phone (6231) 3528748
Fax (6231) 3528749
