

CHAPTER 6

RECOMMENDATIONS FOR FUTURE WORK

- 1) Investigation of the other surfactants or development the procedure for producing the smaller particle sizes of micelle in microemulsion initiatory solution are quite interesting.
- 2) Creation of the best condition for the best usefulness used small amount of chemicals for getting large amount of %add-on, should be studied.
- 3) Usage of the other monomers might offer better color fastness.
- 4) Perhaps, the finishing process could be introduced in order to solve the poor color fastness problem.
- 5) Polymerization with the other monomers to obtain other propperties such as anticrease, flame retardant is very interesting.
- 6) Condition and auxiliaries for cationic dyeing on modified cellulose will be one possibility to improve fastness properties.
