"Please give it to me 5 dollars. I'm very interested in a knife for camping."

"Wouldn't you rather buy it later?" she suggested, "Dad might buy it for you."

"I'd like to buy it myself. If I buy it later, it will be sold out," I answered.

At last Mary gave me a five-dollars bill. I bought that knife. Then she asked me what time it was. I said it was one thirty. (1:30 p.m.)

"I'm hungry," she said.

"And I am, too," I agreed, "Let's look for a place to eat."

Mary didn't like Chinese dishes and I didn't either. So we stopped at a Thai shop where a waiter translated Thai menu for us, and also explained some food ingredient to us. This shop was near a station. I saw a lot of people on the train. "None of them seems unhappy," I thought, "I should have come by train, but I didn't have a chance."

On the way home, we stopped first at grandmother's house where Dad was born, but we could get home in time for dinner. At our back yard, I saw Bob sitting between Dad and Mom and many friends of his were on a bench.

"Beware of that bench!" I exclaimed I loudly. "It has been broken since Sunday."

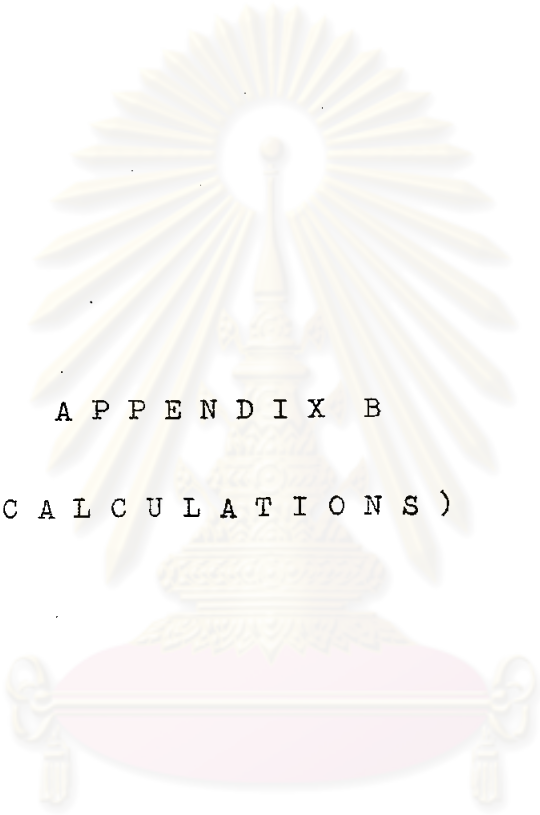

"Don't worry, kids," said Dad, "I fixed it this morning."

"Is that so?" I said. "Here are what we have. This shirt is mine, these pens and soap are yours, Bob, and this meat is Mom's. Nothing is for Dad except this newspaper."

"Thanks," said Bob. "Your shirt looks different from your old one, but it is the same size as mine, isn't it?"

"I think it is," answered I. "And by the way, have you ever been to grandmother's house lately, Dad?"

"Yes, I have. And I will be there tomorrow, too," Dad replied.

I. Calculating for Reliability Coefficients of the Tests

1. The reliability coefficient of the multiple-choice structure test.

$$\begin{aligned}
 r_{tt} &= \frac{n \frac{2}{t} - M_t(n - M_t)}{(n - 1) \frac{2}{t}} \\
 &= \frac{75 \times 88.3859 - 34.355(75 - 34.855)}{74 \times 88.3859} \\
 &= \frac{6628.9425 - 1396.3589}{6540.5566} \\
 &= \frac{5232.5836}{6540.5566} \\
 &= 0.80
 \end{aligned}$$

2. The reliability coefficient of the cloze test.

$$\begin{aligned}
 r_{tt} &= \frac{n \frac{2}{t} - M_t(n - M_t)}{(n - 1) \frac{2}{t}} \\
 &= \frac{75 \times 193.7145 - 26.095(75 - 26.095)}{74 \times 193.7145} \\
 &= \frac{14528.5875 - 12761.759}{14334.873} \\
 &= \frac{13252.4116}{14334.873} \\
 &= .9244
 \end{aligned}$$

Standard Errors of Measurement

$$1. \quad S_E = s \sqrt{1 - r_{tt}}$$

$$\begin{aligned} S_{E.MC_t} &= 9.4013 \sqrt{1 - .8} \\ &= 9.4013 \times .4472 \\ &= 4.2042 \end{aligned}$$

So, the standard error of measurement of the multiple-choice structure test was ± 4.2

$$2. \quad S_E = s \sqrt{1 - r_{tt}}$$

$$\begin{aligned} S_{E.CL_t} &= 13.9181 \sqrt{1 - .9244} \\ &= 13.9181 \times .0756 \\ &= 13.9181 \times .2749 \\ &= 3.826 \end{aligned}$$

So, the standard error of measurement of the cloze test was ± 3.8

II. Calculating for Correlation Coefficients between the Tests

1. The correlation between the scores of the multiple-choice structure test and the cloze test in Group I ($MC_1 \leftrightarrow CL_1$)

$$\begin{aligned}
 r_{XY} &= \frac{N \sum XY - \sum X \sum Y}{\sqrt{[N \sum X^2 - (\sum X)^2] [N \sum Y^2 - (\sum Y)^2]}} \\
 &= \frac{(100 \times 109328) - (3587)(2773)}{\sqrt{[100 \times 138214 - (3587)^2] [100 \times 108945 - (2773)^2]}} \\
 &= \frac{10932800 - 9946751}{\sqrt{[13821400 - 12866569] [10894500 - 7689529]}} \\
 &= \frac{986049}{\sqrt{954831 \times 3204971}} \\
 &= \frac{986049}{1749344.1989} \\
 &= 0.5636
 \end{aligned}$$

r_{XY} was significant at .01 level of confidence
 (0.5636 > 0.258 at 0.01)

2. The correlation between the scores of the multiple-choice structure test and the cloze test in Group II. ($CL_2 \rightarrow MC_2$)

$$\begin{aligned}
 r_{XY} &= \frac{N \sum XY - \sum X \sum Y}{\sqrt{[N \sum X^2 - (\sum X)^2] [N \sum Y^2 - (\sum Y)^2]}} \\
 &= \frac{(100 \times 85059) - (3284)(2446)}{\sqrt{[100 \times 115428 - (3284)^2] [100 \times 65794 - (2446)^2]}} \\
 &= \frac{8505900 - 8032664}{\sqrt{[11542800 - 10784656] [6579400 - 5982916]}} \\
 &= \frac{473236}{\sqrt{758144 \times 596484}}
 \end{aligned}$$

$$= \frac{473236}{672473.6171}$$

$$= 0.7037$$

r_{XY} was significant at .01 level of confidence

$$(0.7037 > 0.258 \text{ at } 0.01)$$

3. The pooled correlation coefficient between the scores of the multiple-choice structure test and the cloze test.

$$\bar{z} = \frac{(n_I - 3) Z_I}{(n_I - 3)}$$

Group	r_I	Z_I	n_I	$n_I - 3$	$(n_I - 3) Z_I$
I	.5636	.640	100	97	62.08
II	.7037	.867	100	97	84.099
				194	146.179

$$\bar{z} = \frac{146.179}{194}$$

$$\bar{z} = 0.7535 \text{ was comparable to } r = 0.640$$

So, pooled correlation coefficient was 0.640

III. Calculating for Correlation Coefficient Differences.

The differences between the correlation coefficients of Group I and Group II.

$$Z = \frac{Z_{r_1} - Z_{r_2}}{\sqrt{\frac{1}{n_1 - 3} + \frac{1}{n_2 - 3}}}$$

$$Z = \frac{.867 - .640}{\sqrt{\frac{1}{97} + \frac{1}{97}}}$$

$$= \frac{.227}{.1435}$$

$$= 1.5818$$

Then was no significant differences between the correlation coefficients of the two groups at 0.01 level of confidence.

$$(1.5818 < 2.58 \text{ at } 0.01)$$

IV. Calculating for Mean Differences

1. The difference between the means of the multiple-choice test and the cloze test in Group I (MC_1 CL_1)

$$H_0 : \mu_1 = \mu_2$$

$$S_{\bar{X}_1 - \bar{X}_2} = \sqrt{s_{\bar{X}_1}^2 + s_{\bar{X}_2}^2 - 2r_{12}s_{\bar{X}_1}s_{\bar{X}_2}}$$

$$= \frac{96.4475}{100} + \frac{323.7344}{100} - 2 \times .5636 \times .98207 \times 1.79925$$

$$= 4.20181 - 1.99172$$

$$= 1.48663$$

$$C.R. = t = \frac{\bar{X}_1 - \bar{X}_2}{S_{\bar{X}_1 - \bar{X}_2}}$$

$$= \frac{35.87 - 27.73}{1.48663}$$

$$= 5.47547$$

The difference between means was significant at 0.01 level of confidence ($5.47547 > 2.576$). It means that the subjects in Group I could score higher on the multiple-choice structure test than could they on the cloze test.

2. The difference between the means of the multiple-choice structure test and the clozen in Group II. (CL₂ → MC₂)

$$H_0 : M_1 = M_2$$

$$\begin{aligned} s_{\bar{X}_1 - \bar{X}_2} &= \sqrt{\frac{2}{s_{\bar{X}_1}^2} + \frac{2}{s_{\bar{X}_2}^2} - 2r_{12} s_{\bar{X}_1} s_{\bar{X}_2}} \\ &= \frac{76.5802}{100} + \frac{76.5802}{100} - 2 \times .7037 \times .87509 \times .77627 \\ &= (1.36841) - (.95605) \\ &= .64215 \end{aligned}$$

$$\begin{aligned} \text{C.R.} = t &= \frac{\bar{X}_1 - \bar{X}_2}{s_{\bar{X}_1 - \bar{X}_2}} \\ &= \frac{32.84 - 24.46}{.64215} \\ &= 13.04991 \end{aligned}$$

The difference between the means was significant of 0.01 level of confidence. (13.05991 > 2.576) It means that the subjects in Group I could score high on the multiple-choice test than could they on the clozen test.

3. The difference between the means of the total multiple-choice structure test and the cloze test. (MC_t and CL_t)

$$\begin{aligned}
 H_0 &: \mu_1 = \mu_2 \\
 s(\bar{X}_1 - \bar{X}_2) &= \sqrt{\frac{s_{\bar{X}_1}^2}{n_1} + \frac{s_{\bar{X}_2}^2}{n_2} - 2r_{12} \frac{s_{\bar{X}_1} s_{\bar{X}_2}}{\sqrt{n_1 n_2}}} \\
 &= \sqrt{\frac{88.3859}{200} + \frac{193.7145}{200} - 2 \times .640 \times .66477 \times .98415} \\
 &= 1.41049 - .83741 \\
 &= .75702 \\
 C.R. = t &= \frac{\bar{X}_1 - \bar{X}_2}{s(\bar{X}_1 - \bar{X}_2)} \\
 &= \frac{34.355 - 26.095}{.75702} \\
 &= 10.9112
 \end{aligned}$$

The difference between the means was significant at 0.01 ($10.9112 > 2.576$) It means that the subjects could score higher on the multiple-choice structure test than they could on the cloze test.

V. Calculating for Sex Effect on the Test Scores.

1. The difference between the means of the male subjects and the female subjects on performing the multiple-choice structure test in Group I.

$$\begin{aligned}
 H_0 &: M_1 = M_2 \\
 s(\bar{X}_1 - \bar{X}_2) &= \sqrt{\frac{s^2}{N_1} + \frac{s^2}{N_2}} \\
 &= \frac{90.7962}{66} + \frac{80.352}{34} \\
 &= 1.3756 + 2.3632 \\
 &= 1.9335 \\
 \text{C.R.} = t &= \frac{\bar{X}_1 - \bar{X}_2}{1.9335} \\
 &= \frac{40.2647 - 33.6060}{1.9335} \\
 &= 3.4438
 \end{aligned}$$

The difference between the means was significant at 0.01 level of confidence. ($3.4438 > 2.576$) It means that the female subjects could score higher on the multiple-choice structure test than could the male subjects.

2. The difference between the means of the male subjects and the female subjects on performing the cloze test in Group I.

$$\begin{aligned}
 H_0 & : M_1 = M_2 \\
 s_{\bar{X}_1 - \bar{X}_2} & = \sqrt{\frac{s^2}{N_1} + \frac{s^2}{N_2}} \\
 & = \frac{348.6567}{66} + \frac{258.7629}{34} \\
 & = 5.28267 + 7.1067 \\
 & = 3.51985 \\
 \text{C.R.} = t & = \frac{\bar{X}_1 - \bar{X}_2}{3.51985} \\
 & = \frac{31.52 - 25.7727}{3.51985} \\
 & = 1.63282
 \end{aligned}$$

At 0.01 level of confidence, there was no difference between the means of the male subjects and the female subjects on performing the cloze test. ($1.63282 < 2.576$). It means that the male subjects (in Group I) could score on the cloze test as well as could the female subjects.

3. The difference between the means of the male subjects and the female subjects on performing the multiple-choice structure test in Group II.

$$\begin{aligned}
 H_0 &: \mu_1 = \mu_2 \\
 s(\bar{X}_1 - \bar{X}_2) &= \sqrt{\frac{s^2}{N_1} + \frac{s^2}{N_2}} \\
 &= \frac{79.9496}{54} + \frac{71.9536}{46} \\
 &= 1.4805 + 1.5642 \\
 &= 1.7449 \\
 \text{C.R.} = t &= \frac{\bar{X}_1 - \bar{X}_2}{1.7449} \\
 &= \frac{45.9411 - 31.8888}{1.7449} \\
 &= 8.0533
 \end{aligned}$$

The difference between the means was significant at 0.01 level of confidence. ($8.0533 > 2.576$) of means that the female subjects could scores higher on the multiple-choice structure test than could the male subjects.

VI. Establishing a Form of Relationship

1. Regression equation

$$\begin{aligned}\hat{Y} &= r_{XY} \frac{s_Y}{s_X} (x - \bar{X}) + \bar{Y} \\ &= .64 \frac{13.9181}{9.4013} (x - 34.355) + 26.094 \\ &= .64 \times 1.48 (x - 34.355) + 26.094 \\ &= .947x - 6.439\end{aligned}$$

Example $X = 45$

$$\begin{aligned}&= .947 \times 45 - 6.439 \\ &= 42.615 - 6.439 \\ &= 36.176 \quad (36)\end{aligned}$$

2. Standard Error of Estimation

$$\begin{aligned}s_{XY} &= s_Y \sqrt{1 - r_{XY}^2} \\ &= 13.9181 \sqrt{1 - (.64)^2} \\ &= 13.9181 \times .768 \\ &= 10.689\end{aligned}$$

3. Corrected Multiple-choice score

$$Sc = R - \frac{W}{C-1}$$

Example $R = 30$

$$\begin{aligned}Sc &= 30 - \frac{45}{4-1} \\ &= 15\end{aligned}$$
