

CHAPTER III

RESULTS

3.1 Efficiency of the Gamma Spectrometer.

Measurements of cesium-137 and potassium-40 activity were obtained with a 3" x 3" NaI(Tl) scintillation detector. The system was calibrated with a set of food samples to which known amounts of standard Cs-137 and K-40 solution had been added. The samples were examined under the same geometry. The result of the efficiency in counting spiked food samples for Cs-137 and K-40 were 3 and 4 percent respectively. The minimum detection limit were thus calculated to be 0.03 and 0.04 pCi/g. wet wt.

3.2 The Reliability test

3.2.1 For strontium-90 determination.

The results of the precision test and the reliability test were tabulated in Table 3 and 4 respectively. The data obtained indicated the good precision and reliability of the extraction procedure.

3.2.2 For calcium determination.

Only the precision test was performed. The result was shown in Table 5. The reproducibility of the titration was rather good.

3.3 Results of the investigation.

The results of the analysis for gross β activity, activity concentration of K-40, Cs-137, Sr-90 and calcium content in 89 samples collecting from January 1976 to January 1977 were shown in Table 6-16. In addition, the range of activity concentration and calcium content was presented in Table 17.

Table 3

The precision for Sr-90 determination by TBP extraction

No. of observation	Concentration of Sr-90 (pCi)
1	5.52
2	5.57
3	5.74
4	5.82
average	5.66 \pm 0.141
amount added	6.0

Table 4

The reliability test for Sr-90 determination by TBP extraction

No. of observation	Concentration of Sr-90 (pCi)
1	2.81
2	2.94
3	3.19
4	3.19
average	3.03 ± 0.189
certified value	3.08

Table 5

The reproducibility of Ca determination.

Amount of Ca added was 99.7 mg.

No. of analysis	permanganate used ml	amount of calcium mg	Error %
1	4.95	97.02	2.7
2	5.00	98.00	1.7
3	4.95	97.02	2.7
average		97.3	2.4
