ฐพาพัชร์ ปุณอานันท์นนท์ : การปรับปรุงกระบวนการจัดซื้อจัดหาวัตถุดิบที่ใช้ใน โรงงานผลิตเครื่องปรุงรส. (PROCUREMENT IMPROVEMENT OF RAW MATERIALS IN A FOOD SEASONING PRODUCTION COMPANY) อ.ที่ปรึกษาวิทยานิพนธ์หลัก: รศ. ดร.ปารเมศ ชุติมา, 116 หน้า.

อย่างที่ทราบกันดีว่าการจัดหาจัดซื้อวัตถุดิบมาใช้ในการผลิตโดยไม่มีการขาดแคลนหรือ การรู้จักหาแหล่งทางเลือกอื่นที่ใช้ในการอุปทานหรือการซื้อในราคาที่ประหยัดและคุ้มค่า (นั่นคือ การซื้อสินค้าที่มีคุณภาพที่ดี ราคาคุ้มค่าและมีการบริการที่ดีจากผู้จัดจำหน่าย) รวมถึงการรักษา ความสัมพันธ์กับผู้จัดจำหน่าย สิ่งเหล่านี้ล้วนแล้วแต่เป็นสิ่งที่จำเป็นในการที่ฝ่ายจัดซื้อจะต้อง ตระหนัก โดยเฉพาะอย่างยิ่งการจัดการเรื่องราคาสั่งซื้อและเรื่องของความเสี่ยงจากการขาดแคลน วัตถุดิบซึ่งถือได้ว่าเป็นสองปัจจัยหลักที่สำคัญ

วิทยานิพนธ์นี้ได้จัดทำขึ้นโดยมีวัตถุประสงค์ที่จะปรับปรุงประสิทธิภาพของกระบวนการ จัดซื้อ ในด้านของราคาและความเสี่ยงของอุปทานสำหรับวัตถุดิบที่ใช้ในการผลิตในอุสาหกรรม ปรุงรส ทั้งนี้ในการวิเคราะห์ปัญหาจะวิเคราะห์โดยการใช้ข้อมูลในอดีต รวมถึงการใช้โมเดลในการ แบ่งประเภทของวัตถุดิบ และในท้ายที่สุดจะนำข้อมูลต่างๆมาใช้ในการสร้างกลยุทธ์และแผนการ ดำเนินงานที่เหมาะสม เพื่อนำมาใช้ในการปรับปรุงกระบวนการจัดซื้อ หลังจากการนำกลยุทธ์และ แผนต่างๆไปใช้กับกระบวนการจัดซื้อจัดหา พบว่าค่าใช้จ่ายรวมของวัตถุดิบที่เลือกมาปรับปรุง ลดลงจาก 238,667,100 บาทต่อเดือนเป็น 221,966,525 บาทต่อเดือน หรือคิดเป็น 7.42% ใน ด้านของความเสี่ยง จำนวนวัตถุดิบที่ถูกจัดให้มีความเสี่ยงสูงก่อนการปรับปรุงกระบวนการจัดซื้อมี 8 วัตถุดิบ หลังจากที่ได้มีการปรับปรุงกระบวนการจัดซื้อจัดหา พบว่าไม่มีวัตถุดิบที่ถูกจัดอยู่ใน กลุ่มความเสี่ยงสูงแต่อย่างใด

5571228321 : MAJOR ENGINEERING MANAGEMENT KEYWORDS: ECONOMIC ORDER QUANTITY / SUPPLY RISK / SUPPLY POSITION

THAPAPATCH PUNARNUNNON: PROCUREMENT IMPROVEMENT OF RAW MATERIALS IN A FOOD SEASONING PRODUCTION COMPANY. ADVISOR: ASSOC. PROF. PARAMES CHUTIMA, Ph.D., 116 pp.

In terms of sourcing and purchasing, uninterrupted flow of raw materials for company operations, find reliable alternative sources of supply, buy at the most economic order quantities best value (a combination of right quality at right quantity at the best price with the best supplier service) and maintain good relations with vendors are significant points to concern. The threats of intensified competition in terms of price and service along with raw materials scarcity are two significant points for the procurement department to consider.

This project attempts to improve the procurement efficiency in terms of price and supply risk of selected raw materials using in a food seasoning company. By analyzing current problems and historical data, those raw materials can be classified and located in supply positioning model. Finally, proper strategies and action plans are applied based on supply position of each raw material and summarized for the improvement result. The results show that the total expenditure of selected raw materials are decreasing from 238,667,100 THB to 220,966,525 THB or 7.42%. For the supply risk aspect, there are 8 raw materials which are classified as high risk before implementing the improvement project. After applying the purchasing improvement project, there are no raw materials classified as high supply risk.

ACKNOWLEDGEMENTS

The thesis is successfully finished by the advisement of Associate Professor Parames Chutima,Ph.D., the thesis advisor. I am very appreciated for his kind advisement. Without his wholehearted support, the thesis might very difficult to undertake and achieve. Moreover, I have to special thanks to my project team for kindly supported information and cooperation as well.

I would like to thank you to my parents, family and colleagues for the moral supports and advises. All difficulties will not be overcome without these supports.

xiv

CHAPTER I

1.1. Introduction

Lacking proper strategy in terms of sourcing and procurement raw materials can increase the cost of goods sold or contract price and supply risk. These two points are concerned as significant points for purchasing department to well plan and control. In terms of price, by not proper procure the raw material at the right time or proper strategy, the contract unit price might not be competitive when compare to the market price. In terms of supply, by having redundant transection process, long supply chain with no value added or mono-supply source can create risks in terms of raw material scarcity and late delivery as well.

Procurement improvement of raw material is the main focus for reducing the contract unit price and minimizing the risk in terms of supply. There are five steps of procurement improvement. Classification the raw material by using the Pareto Analysis is the first step. Selection focusing group of raw material is performed then. Next, do the market analysis by using Five Force Model in order to know the market risk value in each selected raw material. After that, the strategy positioning of each selected raw material can be plotted by using the Supply Positioning Model and Purchasing Portfolio Matrix. The risk value from Five Force Model and relative expenditure from Pareto Analysis can be used as information for plotting raw material position in the model. Finally, the action plan and strategy are created in the final stage.

1.2 Background of Thesis

ABC (Thailand) Limited manufactures and supplies a wide variety of food products, including seasonings, processed foods, beverages, frozen food and edible oils as well as various amino acid-based products, pharmaceutical agents and cosmetics product expanding from Japan to the rest of the world. The main product is a food seasoning. There are four production plants which are PhraPradaeng plant (PPD), PathumThani plant (PTT), KamphaengPhet plant (KPP) and Ayutthaya plant (AYT).

In order to produce these selling products, several chemical raw materials, additive food and others are required. The total purchasing raw materials are 84 items (73

domestic and 11 import raw materials) with the total cost approximately 7,376 million baht per annual.

Raw material type

- Chemical raw materials 61 Items
- Additive food raw materials 11 Items
- Other raw materials 12 Items

In terms of the sourcing and purchasing, uninterrupted flaw of raw materials and services for company operations, find reliable alternative sources of supply, buy at the most economic order quantities best value (a combination of right quality at right quantity at the best price with the best supplier service) and maintain good relations with vendors are significant points to concern. The threats of resource depletion, raw materials scarcity, intensified competition in terms of price and service are very significant points for purchaser to well operate and control. By shortage only one raw material, it can be trouble for the whole production line. Hence, the company especially for procurement department that not well manage their supply, they will not only unsmooth their production and operation but also increase their sourcing and raw material cost as well.

1.2.1 Introduction to procurement improvement of raw material in a food seasoning production company

In order to achieve the improvement targets, the scheme processes can be set and divided into five phases as shown in Figure 1.1.

Chulalongkorn University

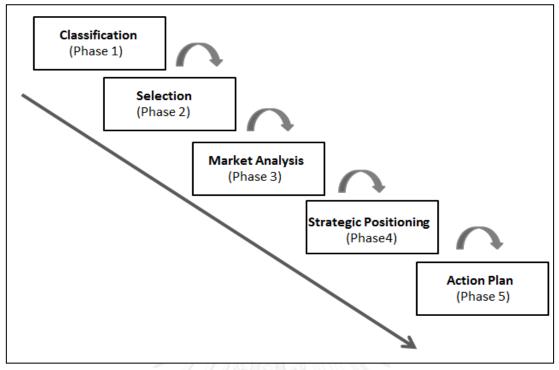

Figure 1. 1 Scheme for improving the supply management (adapted from Peter Kraljic) [1]

Phase 1: Classification

In this phase, the raw material will be classified by using Pareto Analysis based on the percentage of total expenditure cost (show in Appendix A). Those raw materials can be classified into three major classes which are class A (20% of raw material can generate the 80% of expenditure), class B (30% of raw material can generate 15% of expenditure) and class C (50% of raw material can generate 5% of expenditure) [2].

Phase 2: Selection

After raw materials have been classified, the selection of raw materials for improved their supply management and cost reduction is performed then. The selection focuses only on chemical raw material type. The chemical raw material in class A and top five chemical raw materials which have highest expenditure along with high supply risk from class B are selected to improve procurement cost and supply.

Phase 3: Market Analysis

The selected raw materials from phase 2 are analyzed in terms of current market situation. The Five Force Model is used with five perspectives for considering.

- 1st Force: Competitive Rivalry within an Industry
- 2nd Force: Threat of new Entrants
- 3rd Force: Threat of Substitute Products
- 4th Force: Bargaining Power of Suppliers
- 5th Force: Bargaining Power of Customers

By using Five Force Analysis, the market risk score value can be known and plotted into strategic positioning in phase 4.

Phase 4: Strategic Positioning

After knowing the risk supply position of each item, the strategic positioning is analyzed in order to sort out all of the selected items into categories. This category process can be divided into two parts. The first and second part will use Supply Positioning Model and Purchasing Portfolio Matrix respectively. By having the amount of expenditure from Pareto Analysis and supply risk score from Five Fore Model can locate raw material position in Supply Positioning Model. This model can classify raw materials into four different groups which are critical, bottleneck, leverage and routine. By using the analyzed information from Five Force Model, the power of purchaser and supplier can be compared. This can locate raw material in the Purchasing Portfolio Matrix. This model can classify the raw material position into three main groups which are Exploit, Balance and Diversify.

Phase 5: Action Plan

After classified raw materials into three strategic thrusts with different supply position, the action plans for each raw material are created. With different classification, they will have different individual elements in purchasing strategy.

1.2.2 The important procurement improvement of raw material in a food seasoning production company

Because one of the factor that affected to the cost of goods sold is resulting from the cost of raw material. Not well operate in terms of purchasing strategy contract price; the company might struggle to hold the line on their overall cost of goods sold. In terms of production perspective, shortage even one of raw material can halt the whole production line. By having a good supply management along with good sourcing strategies, the company can eliminate the shortage of raw material creating on time delivery with competitive price as well.

1.3 Statement of Problem

There are several chemical raw materials that needed to be purchased and responsible for their movement by ABC (Thailand) Limited procurement team. With large amount of item lists, some of raw materials are not well plan and apply proper strategy for sourcing and performing the contract price. Purchasers might sometime perform contract by just using their habitude without well strategic planning even they have more bargaining power compared with vendors. This can create loss of bargaining power in the long term with high unit cost. Finally, the company will gain less profit because of high cost of goods sold. The selected chemical raw materials for improving procurement efficiency are following.

Sulfuric Acid

Problem

- Not maximize bargaining power

- Creating high offer unit price with not conform to the global price trend

By observing the graph trend line between sulphur FOB (Free On Board) vancouver price and ABC purchasing price, the ABC purchasing price trend is not followed along the FOB (Free On Board) vancouver price trend. For example, when the global price trends to go down, the ABC purchasing price grows up or remains stable as shown in Figure 1.2. This indicates that the purchasing team are not well strategic plan for negotiation and not utilize the purchaisng power efficiently.

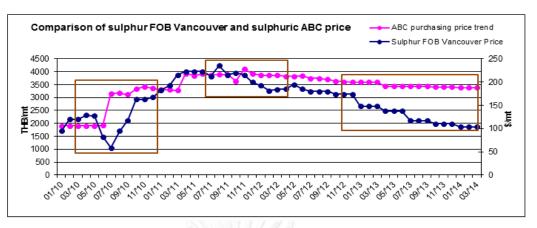

Figure 1. 2: FOB (Free On Board) Vancouver Price vs ABC purchasing price of Sulfuric Acid (Referencing price from FOB Vancouver Price [3] and ABC Purchasing Department)

The reason behind this issue is that there are too several suppliers with no competitive atmosphere. Every supplier will receive the same portion ratio of purchasing volume in every quarter as shown in the Table 1.1.

| Supplier Name | Purchasing Quantity Ratio |
|---------------|---------------------------|
| H Co., Ltd | 30% |
| X Co., Ltd | 20% |
| V Co., Ltd | 20% |
| Y Co., Ltd | 20% |
| Z Co., Ltd | 10% |
| Total | 100% |

Table 1. 1: The portion of purchasing volume from current suppliers

<u>Potassium Chloride</u>

Problem - Monopoly supplier

- Less bargaining power
- High risk due to only one supply source

As the purchasing price and global price trend show in the Figure 1.3, the purchasing price trend is not followed along the global trend line in some of particular period. For example, when the global price trends to go down, the ABC purchasing price grows up or remains stable.

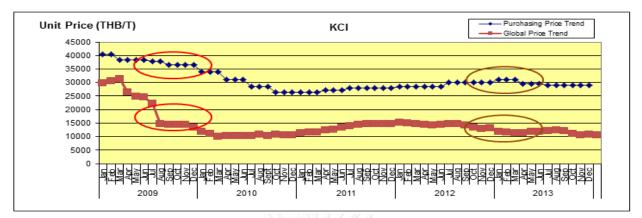

Figure 1. 3: Global Price Trend vs Purchasing Price Trend of Potassium Chloride (Referencing price from Fertecon Potash Report 2009-2014 [4] and ABC Purchasing Department)

The reason behind this issue is that there is only one trader suppling this raw material to ABC. Hence, the purchasing team might loss the bargaining power along with high risk due to no second source and monopoly supply.

Ammonium Chloride

Problem - Monopoly supplier

- Less bargaining power

- High risk due to only one supply source

As the graph in Figure 1.4 shows, the Ammonium chloride price almost conforms with Ammonia and Hydrochloric acid (two main raw material for producing Ammonium chloride) price trend. However, there is only one supplier supplied this product to ABC. Supplier offers the unit price as same as every month hence, the graph will show the stable offer unit price even the global price trends to decrese or even increase.

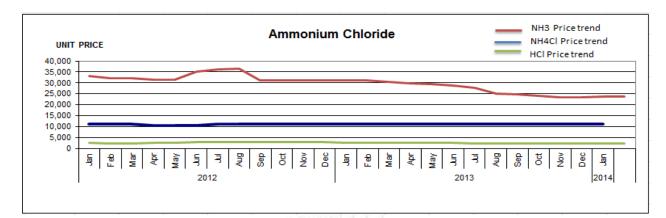

Figure 1. 4: Amonia, Hydrochloric acid and Ammonium chloride price trend (Referencing price from ABC purchasing department)

By having only one supplier, there is no competitive atmoshere along with no comparing offer price when performing the contract. This can create loss of bargaining power in the long term.

<u>Coal</u>

Problem - Not creating competition atmoshere to supplier

- High expenditure due to not well strategic plan for choosing product specification creating high consumption per day

Table 1. 2: The contract price, allocated volume and coal specification of each supplier

| | | Price offer | | Calorific | ARB | | Price | | Purchasing plan | | | | |
|------------|------------------|--------------------|-----------|-------------------------|-----------------------|----------------|-----------------|------------|-----------------|--------------------|--------------------|--------------|------------|

| Total | 330 | | | | | | | | | | Total | 76,680,000 | |
| | | | | | | | | | | | Avg. Price | 2,581.82 | |

As the Table 1.2 shows, there are several suppliers receiving a few purchasing volume per day. For example, some supplier supply only one truck (30 T/truck) which is not maximized utilizing their capacity. This creates high offer unit price. In terms of the product specification, coal specification can easily vary to the environment factors. Hence, calorific value, sulfur emission, moisture and ash are the factors that needed to concern when performing the contract as well. Some supplier offer high calorific value (\geq 5,800 Kcal), some offer low-medium calorific value (5,500-5,800 Kcal). The high calorific value can lower the consumption per day but need to trade off with increasing in unit price. Hence, by creating the right portion between high and low heat calorific value along with negotiation for competitive price are needed to be performed in this raw material.

<u>Urea</u>

Problem

- Monopoly supplier

- Not optimize using Urea as an alternative product of Ammonia

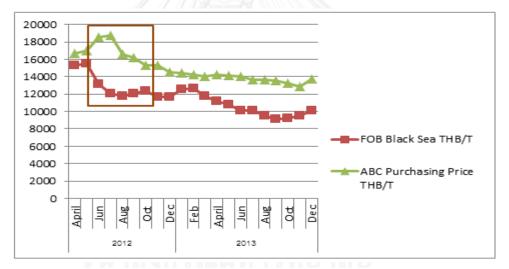

Figure 1. 5: Compare FOB Black Sea Price and ABC Purchasing Price of Urea

(Referencing price from ABC Purchasing Department)

As the Figure 1.5 shows, urea market price is dramatically decreasing in June 2012. At that time, the ammonia is almost totally converted to urea due to high demand of fertilizer. However, even the global urea price is significant decreasing, ABC purchasing team still bought with high unit price. This is because ABC has to purchase large amount of urea quantity instead of ammonia in this urgent period with only one available urea supplier in a company approved vendor list.

| Urea Vs Ammonia Consumption | | | | | | | | |
|-----------------------------|-----------|-----------------|-------------|-------------------|--|--|--|--|
| Month | Urea (MT) | Ammonia (MT) | Urea %Ratio | Ammonia %Ratio | | | | |
| Apr-12 | 200.00 | 3700.00 | 10% | 90% | | | | |
| May-12 | 200.00 | 3780.00 | 10% | 90% | | | | |
| Jun-12 | 600.00 | 3550.22 | 25% | 75% | | | | |
| Jul-12 | 600.00 | 3560.00 | 25% | 75% | | | | |
| Aug-12 | 600.00 | 3506.00 | 25% | 75% | | | | |
| Sep-12 | 200.00 | 3712.83 | 10% | 90% | | | | |
| Oct-12 | 200.00 | 3790.25 | 10% | 90% | | | | |
| Nov-12 | 200.00 | 3731.74 | 10% | 90% | | | | |
| Dec-12 | 200.00 | 3754.22 | 10% | 90% | | | | |
| Jan-13 | 200.00 | 3700.00 | 10% | 90% | | | | |
| | - | | - | | | | | |
| Feb'13 - | - | - | - | - | | | | |
| | - | - | - | - | | | | |
| Mar'14 | - | - | - | - | | | | |
| | - | | - | | | | | |

Table 1. 3: The Consumption Ratio of Ammonia VS Urea

As the Table 1.3 shows, by shortage of Ammonia in June 2012, ABC has to urgent purchase urea as an alternative for ammonia. The percentage ratio for using urea versus ammonia is 25% per 75%. However, after the situation subsides and to be normal in September 2012, purchaser still maintains to use urea: ammonia as 10:90 till March 2014 even urea price is more competitive. There is only 5-10% of urea portion. This might not create the significant profit.

Antifoam GD-113 and Succinic Acid

Problem - Long supply chain and several parties' cooperation creating high risk, long lead time and high unit price due to several premium costs added

- Monopoly supplier creating loss bargaining power

- The contract is performed as monthly basis. This initiates redundant work to the purchaser and can increase human error as well

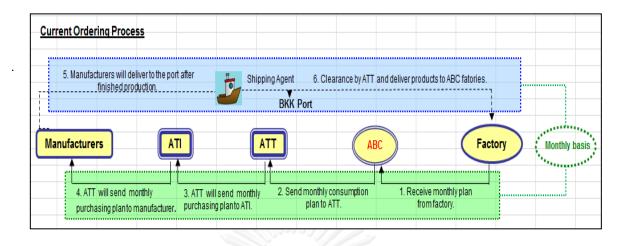

Figure 1. 6: The Current Ordering Process of Antifoam GD-113 and Succinic acid

As the Figure 1.6 shows, ABC purchasing team receives antifoam GD-113 and succinic acid monthly consumption plan from factory before using approximately 4 months. This consumption plan and purchasing order are forwarded forth and back along the chain. With several parties along the chain and monthly basis operation, this can create longer lead time, high premium cost added and create human errors as well.

<u>Ammonia</u>

In order to produce ammonia, natural gas is used as main raw material. Ammonia can be converted to urea which is normally used as a main raw material for fertilizer (shows in figure 1.7).

Figure 1. 7: The Ammonia Gas and Urea Production Process

Normally, ammonia supply chain is shipped from manufacture located in Indonesia (Main source for supply ammonia in Asia). By rising in the fertilizer demand in a particular period of time, more ammonia ratio is converted to urea in order to produce fertilizer using in their local country. Hence, there is not enough ammonia for export to other countries. By relying on only one source, our suppliers (A Co.,Ltd and B Co.,Ltd) cannot search for new supply sources and not on time delivery. ABC (Thailand) Limited had to face with ammonia shortage situation (shows in Figure 1.8).

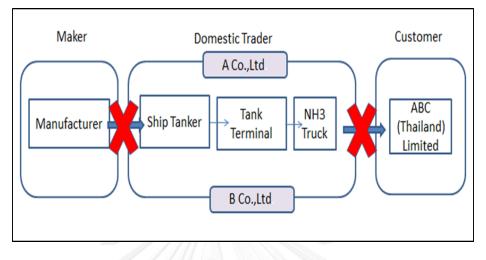

Figure 1. 8: Ammonia Supply chain

Normally, the total consumption ammonia per month is approximately 2,378 T. However, in crisis situation, supplier can supply this raw material only 1,276 T. or 46% decreasing from normal case as shown in Figure 1.9.

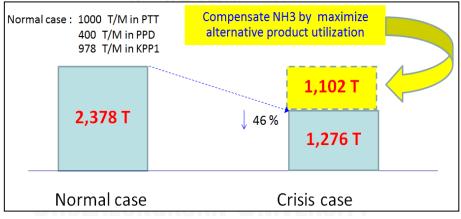

Figure 1. 9: The Ammonia Shortage Situation

Caustic Soda and Hydrochloric acid (Chlor-Alkali)

Due to Japan earthquake (Tsunami), C Co.,Ltd in Japan had to shut two of its three caustic soda plants after they were damaged by the earthquake. By C 's global policy, C in Thailand which is main domestic maker suppling Chlor-Akali to ABC (Thailand) Limited (62% of ABC's total caustic soda consumption) had to transfer additional caustic Soda to C in Japan to supplement their local production. Hence, there is only a few portions which are approximately 38% supplied from other traders to ABC (Thailand) Limited. This situation is not only affected to the caustic soda supply but also hydrochloric acid due to co-products.

As showed in the Figure 1.10 below, there are, normally, four suppliers supplied caustic soda and hydrochloric acid to ABC. By reducing in caustic soda and hydrochloric acid volume from C Co.,Ltd who is concerned as a major supplier in chlor-alkali business, this can create raw material shortage to ABC.

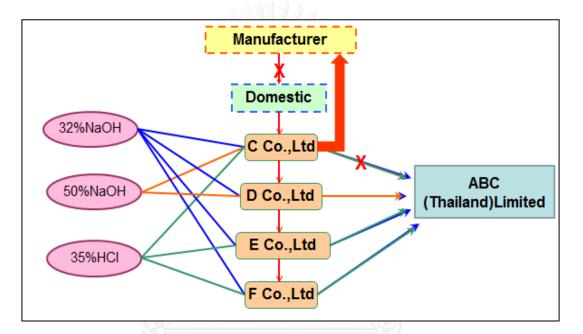

Figure 1. 10: The Caustic Soda Supply Chain

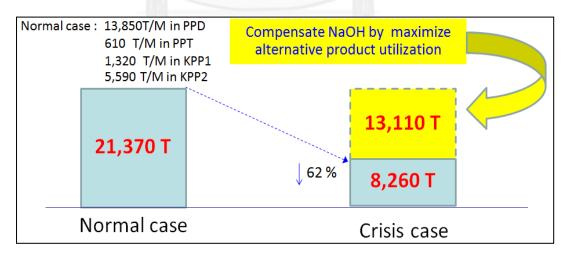

Figure 1. 11: The Caustic Soda Shortage Situation

As shown in the Figure 1.11, the consumption of caustic soda per month is 21,370 T. When the shortage situation occurred, the volume of supply is reduced to 8,260 T. The conclusion of above problems can be stated as below.

In terms of raw material price

- No proper strategies for each raw material when performing the contract
- Loss bargaining power due to no competition atmosphere among the suppliers
- Long supply chain with more premium cost added, creating high unit offer price as a result

In terms of supply

- High risk due to no alternative products
- High risk due to no alternative sources and vendors
- Long supply chain creating more lead time and risks along the chain

1.4 Objective of Thesis

The objective of this thesis is to improve the procurement of chemical raw material in a food seasoning production company in order to reduce cost for souring raw material and minimize risk in terms of supply.

1.5. Scope of Study

The study will focus on minimize supply risk, make most of buying power and cost reduction for sourcing chemical raw material in class A and top five highest expenditure along with high supply risk from class B. The following topics will be included.

1). Classify the list of raw materials by using Pareto Analysis tool based on amount of annual expenditure into three classes (Appendix A)

Annual Expenditure Calculation

To calculate annual expenditure, it can be calculated by using contract unit cost multiply with contract volume as below equation. The contract unit cost is included raw material cost, transportation, exchange rate, premium cost, clearing charge, operation cost and profit. However, this cost structure is depended on the nature of raw material such as domestic or import product.

Expenditure per contract = Contract Unit Cost X Contract Volume

Contract Unit cost structure = Raw material cost + Transportation cost + Exchange rate+ Premium Cost + Clearing charge+ Operation cost+ Profit

Amount of annual expenditure = The sum of total expenditure per contract in the particular year

Word Definition

Unit Cost:

Unit cost refers to the contract price that supplier offers to buyer. There are several component costs are added in unit cost structure. Different raw material might have different unit cost structure. For example, the domestic raw material has no exchange rate, premium cost and clearing charge are added in the unit cost structure.

Raw material Cost:

Raw material cost is the cost of raw material itself. Mostly, raw material price is depended on demand and supply in a particular period.

Transportation Cost:

Transportation cost is the transaction cost of raw material. The transportation cost is depended on the delivery type agreement. ABC has two contract types which are delivery to factory and ex-factory

Exchange rate:

This value refers to the money exchange rate. It depends on appreciation and depreciation of Thai baht against the foreign rate.

Premium Cost:

Premium cost is the cost that each supplier added along the supply chain. The more number of suppliers or parties relevanted in the supply chain, the more premium costs are added along the chain.

Clearing Charge:

Clearing charge is the transaction fees. When the product arriving to the port, the shipping company has to pay for this cost.

Operational Cost:

Operational cost is the cost of business operating, producing or managing raw material such as warehousing cost and etc.

Profit:

Profit or margin is an added up price when supplier selling their product. Supplier is normally set up their profit as a fix percentage in their cost structure.

2). Only chemical raw material from class A and top five highest expenditure with high supply risk chemical raw material from class B are focused as shown in Table 1.4.

| <i>N0</i> . | MATERIAL LIST | <i>N0</i> . | Amount | Cumulative | % total | Group |

Hence, there are ten selected raw materials for performing procurement improving in terms of price and supply. After apply the analyzing tools and models which are Five Force Analysis, Purchasing Portfolio Matrix (Figure 1.12) and Supply Positioning Model (Figure 1.13), the raw materials can be classified in to four different groups which are critical, bottleneck, leverage and routine.

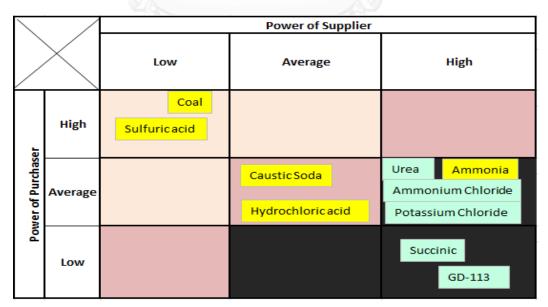

Figure 1. 12: Classify Raw Material into three groups by using Purchasing Portfolio Matrix

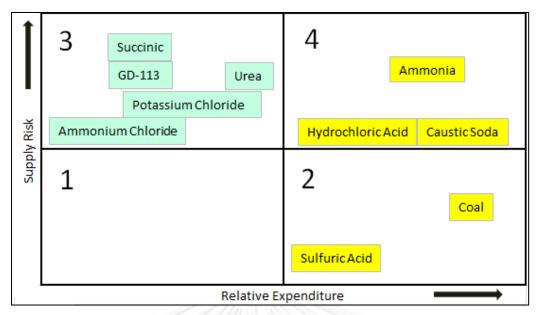

Figure 1. 13: Supply Positioning Model

(1. Routine position, 2. Leverage position, 3. Bottleneck position and 4. Strategic position)

1.6. Proposed Methodology

1). Classify the list of raw materials based on amount of annual expenditure into three classes which are class A,B and C ranking from highest expenditure to lowest

2). Select chemical raw material from class A and top five highest expenditure with high supply risk chemical raw material from class B in order to improve their supply along with cost reduction

3). Perform market analysis by using the Five Force model, the Competitive Rivalry within an Industry, Threat of new Entrants, Threat of Substitute Products, Bargaining Power of Suppliers and Bargaining Power of Customers are analyzed then, the level of the risk value is evaluated.

4). Plot the product to the strategic positioning, there are two models which are Supply Positioning Model and Purchasing Portfolio Matrix applied in this phase. The raw material risk value and company buying strength against the strengths of the supply market can be known respectively.

5). Set the action plan and strategy implementing to each selected raw material

6). Review result and create long term strategy

1.7. Expected Benefits

1). Can indicate the raw material position in terms of supply risk versus relative expenditure and relative bargaining power between supplier and buyer

2). Can create the action plan for improving supply management and cost reduction to each selected raw material

3). For the items that have an alternative, the breakeven point formula can be indicated and used in the real situation for deciding the contract

4). Can create competition atmosphere in order to make most of buying power with cost reduction as a target, by reducing the purchasing expenditures can therefore result in substantial improvements of the profit margin

5). For raw material with long supply chain, improve the supply route and find alternative source are needed to be achieve in order to minimize lead time and reduce risk as well

CHAPTER II

LITERATURE REVIEW

This chapter describes the related previous research and literature review. The review describes the important of purchasing and supply management. This session describes the important of purchasing department and function along with benefit for applying supply management to improve purchasing efficiency. Next, the four stages approach for improving purchasing efficiency is described. There are four steps which are classifying the list of raw material, performing the market analysis to each of raw material, locating the selected raw material to proper strategic position and creating the action plan at the end. The last session is conclusion which summary all of the literature review topics. The review topics are indicated below.

2.1 The important of purchasing and supply management

2.2 Measuring purchasing supply management and financial performance

2.2.1 Lever analysis

2.3 Four stages approach for improving purchasing efficiency

2.3.1 Phase 1: Classification

2.3.2 Phase 2: Market analysis

2.3.3 Phase 3: Strategic positioning

2.3.3.1 Supply positioning model

Strategy for moving the matrix

2.3.3.2 Analyzing buyer and supplier power

- Purchasing Portfolio Matrix

2.1.4 Phase 4: Action plan

2.4 Conclusion

2.1 The important purchasing and supply management

Nowadays, purchasing is not concerned as a support department. It is considered as a strategic element of a company's structure. This due to the fact that there is high competition in term of the business operation, reduce cost along with increase revenue in order to gain high profit margin is the business target. Several manufacturing companies spend more than half of the sale turnover on purchased parts, raw material and services. As stated in Carl Fenson and Par Edin's research [5], the cost of goods sold is approximately 60 percent of the production value. Hence, the companies that able to enhance procurement understanding along with develop the buying process via supply management; they are not only reducing cost but also minimizing risk from raw material shortage as well.

2.2 Measuring purchasing supply management and financial performance

The scheme for measurement the purchasing & supply management and financial performance is stated in the Figure 2.1. As Evi Hartmann, Dieter Kerkfeld and Michael Henke's research stated [6], the performance of purchasing and supply management (PSM) outcome can be measured into two different perspectives. The first perspective is PSM performance outcomes. The second perspective is financial performance outcomes. In order to measure the PSM performance outcomes, there are five drivers as following.

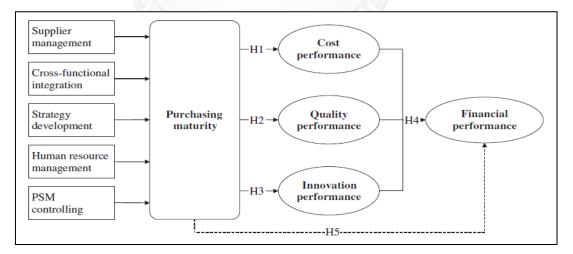

Figure 2. 1: Model of purchasing & supply management drivers and performance outcomes [6]

1). Supplier management

Supplier management is concerned as a core responsibility of PSM for dealing with the interface of supply base. The research states a shift for many categories away from the traditional emphasis on cost and quality toward increasing technological reliance on suppliers' capabilities to design processes and products. The growing of supply management on the supply base in order to create competitive advantages has increased the expectation of senior management about vendor performance [6]. Therefore, purchasing and supply management has a strong interest in managing the capabilities and performance of supply base [7].

2). Cross-functional integration

The cross-functional interaction and collaboration accentuates the PSM in terms of improvements with other functions such as product development, alternative product implementation and marketing. This indicates that the purchasing function is equally important to other strategic functions such as production, marketing or finance [8]. Before other functions consider inputs from PSM, they must accept it as being strategic and legitimate. Hence, by working as a cross-functional, it can indicate how well purchasing function is institutionally accepted and legitimized by other functions and senior management.

3). Strategy development

The purchasing and supply management strategy development has to support and consist to the firm's capabilities. This can be performed by three stages. First, PSM must have a formally written strategy. Second, PSM's strategy needs to be reviewed and adjusted regularly to match to the firm's strategy. Third, PSM's strategy requires to include a strategic category sourcing approach.

4). Human resource management

Purchasing professionalism is considered a significant antecedent to strategic purchasing [9]. Skill level has been found to be important in establishing an interface with technical functions especially when purchasing is integrated into new product development project. As Carr and Smeltzer's research [10], they also stated that to fulfill the purchasing and supply improvement, human management is very significant point to concern. Develop and train over time along with appropriate allocated to tasks are the way to motivate PSM professionals to pursue the required development.

5). Purchasing and supply management controlling

Performance measurement and control is not an easy exercise especially where purchasing and supply value chain are considered [11]. In order to perform PSM controlling, target setting and performance appraisals on the PSM team level have to create shared goals. This can encourage the responsibility toward the team and its individual members.

Purchasing can directly influence savings on materials and services by reducing the cost of purchased raw material over the time. Moreover, the contribution of purchasing to overall success exceeds cost reductions is supporting manufacturing performance [12] or innovation [13]. For the financial performance outcomes perspective, it is mainly focusing on cost reduction which concerned as a key of a financial. There are two main concepts emerged along this line. First, reductions in the costs of goods sold were attributed to PSM. Second, the utilization of PSM employees improved such as reduction in overhead costs. However, the second approach is attracted little to no interest from academia due to their over-simplicity.

To indicate the challenges at the output level, the cost, quality and innovation performances as stated as following are expected to illustrated direct operational benefits from improvements in PSM activity.

1). Effect of PSM drivers on cost performance

As Carr and Pearson's research [14], cost savings are the primary target of PSM because it is influencing up to 80% of a firm's costs. The tackle of costs is from two ways. First, it can rationalize the demand for purchased goods and services on the business side. Second, it can lower the costs for goods and services on the supply side. On the business side, PSM can issue guidelines, substitute components and share resources. For

the supply side, PSM can create a supply base that offers the required goods and services at the lowest total cost which are purchasing price and logistic cost.

2). Effect of PSM drivers on quality performance

There are three factors affected to the quality performance which are optimizing the supply base, improving and developing the suppliers' capabilities and ensuring reliability of the supply chain to maintain the desired quality level. To implement a quality strategy, PSM needs to identify and select superior suppliers and monitor their performance [15]. There are defining, tracking and discussing performance measures of every supplier on a regular basis.

3). Effect of PSM drivers on innovation performance

Innovation can create cutting edge of product and service. It can differentiate themselves from competitors. The innovation can improve efficiency, quality, style and technology. PSM's access to its supply base opens the opportunity for several strategies along with significant innovations than companies could achieve alone from exploiting internal resources [16].

2.2.1 Lever Analysis

Lever analysis is a tool for measuring and identifying cost reduction. Identify the total cost of ownership (TCO) which is concerned as a purchasing tool aimed at understanding the true cost of purchasing especially service and goods from particular supplier [17] and perform in depth analysis of the relevant cost composition can lead to identify the proper cost reduction. The cost reduction can be performed by supplier consolidation such as leveraging volume and choosing best supplier or can be performed by innovation and continual improvement such as changing usage patterns and etc.[18]

Lever analysis has been applied by many consulting companies. This is a set of measurement of sourcing performance improvement in a commodity group. The traditional form of lever analysis considers six sourcing levers which are pooling, price evaluation, global sourcing, product optimization, process improvement and supply relationship [19]. However, there are 10 experts who had experience in over 100 commodity group saving projects, they revised lever workshop methodology in three firms, a seventh "commodity-spanned" lever was added [20] as shown in Figure 2.2.

However, all seven levers must be simultaneous considered in order to eliminate trade-offs. For example, the lever global sourcing may work against a strategy to intensify relationships in order to profit from local supply cluster [21].

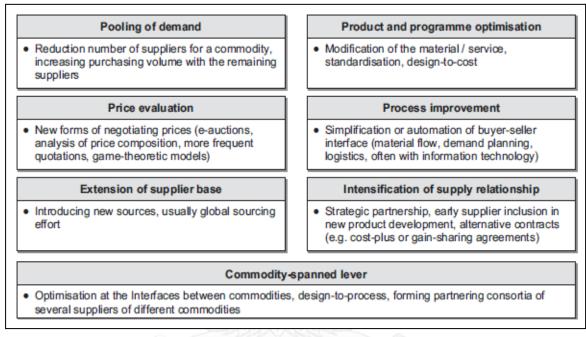

Figure 2. 2: The seven sourcing levers [20]

2.3 Four stages approach for improving purchasing efficiency

To minimize risk and make most of the potential of buying power, there are four stage approach indicated by Peter Kraljic [1] for achieving in this issue.

2.3.1 Phase 1: Classification

First, the company has to classify its purchased materials or items. This can be classified by using volume of purchase basis, percentage of total purchase cost, expenditure cost or business growth. Using these criteria, the company can sort out all of the purchased items. Pareto analysis can be used as a helping tool in order to classify the list of the purchased raw material.

2.3.2 Phase 2: Market analysis

To perform the market analysis, Five Competitive Force can be used as a helping tool. As Michael E.Porter 's article [22], the five issues (show in Figure 2.3) for analyzing the market analysis are following.

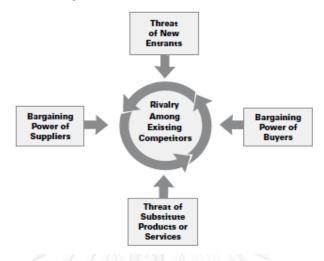

Figure 2. 3: The Five Forces that Shape Industry Competition [22]

1). Threat of Entry

New entrants can bring new capacity along with desire to gain the current demand. This can increase the competition and pressure on prices, costs and the rate of investment in term of supply. Particularly to the new entrants who are diversifying from the markets can leverage the existing capabilities and cash flows to shake up competition. The threat of new entry depended on the entry barriers that available in the current market. If the entry barrier and current market competition are low, the threat of entry is high.

2). Power of Suppliers

Suppliers that have a powerful power can charge higher prices, limit quality and service or shift cost to industry participants. If there is no alternative or substitute product available in the market, the supplier power will be enhance.

3). Power of Buyers

The customers who have power for negotiation can capture more value for price costing down; enhance product quality and more service from the supplier as well. The characteristic of powerful customer are indicated below.

- There are few purchasers with large amount of volumes relative to the size of the single vendor.
- If the buyers believe that the product is standard and can easily sourcing in the market, they tend to play one supplier against another in order to increase the purchasing power.
- If the switching cost for changing the product is low, the buyers will have more bargaining power and can change vendors whenever they require.

4). Threat of Substitute Product

The substitute product means the product that can perform the same or similar function as an industry's product. By having the substitute product, buyers tend to have more bargaining power in term of negotiation and compare the offer price between industry's product and substitute. The product that has a competitive position in term of price and supply will be chosen by buyer.

5). Rivalry among existing competitors

There are several rival forms among the existing competitors. There are advertising campaigns, service improvement, price discounting and new production introductions. With high rivalry of these factors can decrease the profitability of an industry. The factors that enhance the rivalry among existing competitors are following.

- There are several competitors existing in the current market. If the competitors are numerous or roughly equal in size and power, the company might find hard to survive in the business.
- The growth of industry can affect to the competition in the market. If the growth of industry is slow, this can precipitate the fight among the competitors in term of market share.

• If the exit barriers which are opposite to the entry barriers are high, these barriers can keep the companies in the market even they may gain low or negative returns. This brings about excess capacity remains in use in the supply market.

Consideration point for using Five Force Analysis

- Five Force Analysis can be used where there are at least three competitors in the market.
- The impact of the government should be concerned when performing the analysis.
- The dynamic or changing characteristics of the industry should be considered [23].

2.3.3 Phase 3: Strategic positioning

After performing classification and market analysis, the strategic positioning can be analyzed by using supply positioning model and purchasing portfolio matrix respectively.

2.3.3.1 Supply Positioning Model (Kraljic's Approach)

To categorize the number of raw material, supply positioning model as shown in Figure 2.4 can be used. The model will indicate the allocation of resources across the organization as well as identifying appropriate procurement procedures in the Table 2.1. The materials can be classified into four groups as following.

- Critical or Strategic: High profit impact with high supply risk
- Bottleneck: Low profit impact with high supply risk
- Leverage: High profit impact with low supply risk
- Routine or noncritical: Low profit impact with low supply risk

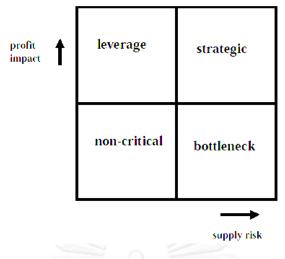

Figure 2. 4: Supply Positioning Model [24]

| Table 2. 1: Main | Tasks and Req | uired Information | of Supply F | Positioning Model [22] |
|------------------|---------------|-------------------|-------------|------------------------|
| | | | | J |

| Supply Position | Main Tasks | Required Information |
|-------------------|----------------------------------|--------------------------------|
| | -Accurate demand forecasting | -Highly detailed market data |
| | -Detailed market research | -Long-term supply and demand |
| Strategic Items | -Development of long term | trend |
| | supply relationships | -Good competitive intelligence |
| | -Risk analysis | -Industry cost curves |
| | -Control of Vendors | -Medium term supply and |
| Bottleneck Items | -Security of inventories | demand forecast |
| | -Back up plans | -Very good market data |
| (C | -Contract/spot purchasing mix | -Good market data |
| | -Vendor selection | -Short to medium term demand |
| | -Product substitution | planning |
| Leverage Items | -Target pricing strategies and | -Accurate vendor data |
| Leverage items | negotiations | -Price/transport rate forecast |
| จห | -Order volume optimization | ยาลัย |
| Я ¹ | -Exploitation of full purchasing | |
| C | power | VEDOITY |
| UNU | -Product standardization | -Good market overview |
| Noncritical Items | -Order volume monitoring | -Short-term demand forecast |
| | | -Economic order quantity |
| | | inventory levels |

As Marjolein C.J.Caniels and Cees J. Gelderman's research [25], the materials which are in the strategic quadrant in supply positioning model, both supplier and purchaser should have a good mutual understanding. Critical analysis in terms of the market, risk, optimization models, price forecasting including various other kinds of microeconomic analysis is needed. For the bottleneck quadrant, the purchaser should ensure a constant supply by keeping high stocks and specific market analysis is required. For leverage quadrant, procurement department should let those suppliers prevail for the lowest offer price. E-procurement might be used for competitive bidding and short-term contract. Lastly, non-critical quadrant, the similar package of product with certain supplier is preferable. It is also possible to have only one supplier for several products.

Although there are other available models, supply positioning model or Kraljic's approach became the dominant approach to what the profession regards as operational professionalism [26]. As Lamming and Harrison's research stated [27], they also confirmed that supply positioning model remains the foundation of purchasing strategy for several organizations across different sectors.

Strategy for moving the matrix

In order to create strategy to each type of raw material in the supply positioning model, Marjolein C.J. Caniels and Cees J. Gelderman's research [25] states the strategy solution as following.

1). Strategic Items

These items are concerned as value to the organization in term of large impact to the profit along with high supply risk. Strategic items are normally purchased from single source or one supplier causing a high supply risk to the company. The recommendation and scenario of supplier management in this position are following.

Scenario 1: Maintain strategic partnership

In order to balance the supply risk, company will aim to build the partnership relationship with supplier. The commitment and mutual trust that is associated with an intensified relationship is likely to reduce the supply risk to a minimum. With close relationship to supplier can improve the product quality, delivery, lead times and cost reduction. This situation can be characterized as one with balanced power between buyer and supplier hence, mutual dependence is expected to be high.

Scenario 2: Accept a locked- in partnership

This situation is concerned as supplier dominance while the buyer is in the unfavorable conditions. For example, the supplier might hold the patent to a certain product. Supplier and buyer in this condition are not much involved in the partnership as scenario 1 above.

Scenario 3: Terminate a partnership

When the supplier performance is unacceptable, the buyer should attempt to reduce the supplier dependence such as search for the alternative supplier or terminate in a partnership.

2). Bottleneck Items

These items have moderate influence on the firm financial result. The supplier trends to have dominant power. The recommend strategy for this product position is to reduce the negative effects of the unfavorable position such as find other suppliers and move towards the non-critical quadrant.

Scenario 1: Accept dependence and reduce negative consequences

This strategy is to ensure the supply even it needs to have an additional cost. For example, the company might keep the extra stocks of raw materials or develop consigned stock agreement with supplier.

Scenario 2: Reduce dependence and risk, find other solutions

This strategy aims to reduce the dependence of supplier. The company might broaden the specifications of the product or search for new supplier.

3). Leverage Items

These items are concerned as large share of the end product's cost price in combination with relative low supply risk. Obtain various suppliers can make buyer has several incentives and possibilities for negotiation. Only small percentages of cost savings usually involve large sums of money.

Scenario 1: Exploit buying power

Because suppliers and products are interchangeable, there are no needed for long term contract. Buyer might do the competitive bidding in order to dominance over the suppliers.

Scenario 2: Develop a strategy partnership

This scenario is concerned as a few practitioners. It is dealing about adopting the leverage to the strategic position. This cooperative strategy is only acceptable when the supplier is willing and able to competitive advantage of the buyer's firm.

4). Non-critical Items

The nature of the item in this position is having a small value per unit and many alternative suppliers can be found.

Scenario 1: Pool purchasing requirements

The main strategy is to enhance the purchasing power by bundling and standardization of purchasing requirements. This can reduce the cost of logistic and administrative complexity.

Scenario 2: Individual ordering and efficient processing

When the pool purchasing cannot apply, the purchaser might adopt some kind of individual ordering such as purchasing card application. This strategy attempts to reduce the indirect purchasing costs that are involved in administrative activities such as invoicing and ordering.

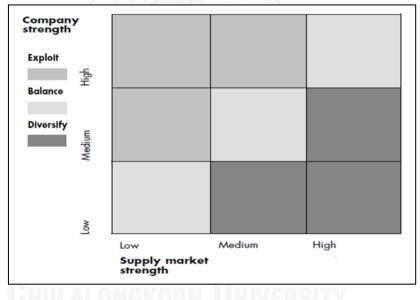

2.3.3.2Analyzing buyer and supplier power

In order to determine the supplier versus buyer power, there are several supporting tools and models. In this thesis, the author describes the related tool which is purchasing portfolio matrix and relevant research which is buyer and supplier dependence.

Purchasing Portfolio Matrix

This tool can identify areas of opportunity or vulnerability, assess supply risks and derive basic strategic thrusts for the purchasing product. The Purchasing Portfolio Matrix plots the power of purchasing against the power of supplier. This can be used for develop counterstrategy or reverse marketing as well. There are three basic categories shown in the Figure 2.5, each associated with a different strategic thrust as following.

- Exploit: Items where the company plays a dominant market role while suppliers' strength is rated medium or low.
- Diversify: Items where the company's role in the supply market is secondary while suppliers are strong.

• Balance : Items with neither major visible risks nor major benefits

Figure 2. 5: Purchasing Portfolio Matrix [1]

As Kornelius and Van Stekelenborg research [28] stated, there is not enough for only focusing on the power balance between buyer and supplier. To exploit the buyer power can be a strategy that works in a short term especially in term of cost reduction but not permanent achieve in the long run. However, the main critique concerns the need of model in order to assist in the management of the company's entire portfolio of relationship.

<u>Relevant research</u>

As referencing from the Marjolein C.J. Caniels and Cees J. Gelderman's research [25], the different in buyer and supplier perspective is analyzed in order to compare and analyze for the interdependency.

| Construct Components | Buyer's dependence | Supplier's dependence |
|-------------------------|---|--|
| Logistic | Logistical indispensability | Financial magnitude |
| Technology | Need for supplier's technological expertise | Need for buyer's technological expertise |
| Availability of | Availability of alternative suppliers | Availability of alternative buyers |
| Switching costs | Switching costs buyer | Switching costs supplier |

Table 2. 2: Buyer and supplier interdependency [25]

As the Table2.2 shows, the dependency of each construct components is different depending on the perspective side (buyer or supplier). For the logistic based dependence, the buyer focuses on the way of receiving goods. The logistic congruent to buyer's production system and correct delivery of goods are significantly concerned while the main consideration for supplier is the financial nature. For the technology issue, the need for the technological expertise is critical for both parties. The buyer requires for the advanced technology from the suppliers. Hence, supplier has to increase the critical specialized to the customers. For the alternative sources and products, buyer and supplier are depended on each other. When buyer invests specific dedicated equipment with specific supplier, this will result in high switching costs if the relationship is terminated.

2.3.4 Phase 4: Action plan

After performing the product and supplier analysis, the company should create both short term and long term plan. To plan and apply the purchasing strategy to each type of raw material position is different depending on the nature of the product and supply. For instance, the priority purchasing strategy for the bottleneck itemswhere the supplier's strength is more than the buyer, minimize the risk is highly concerned rather than cost reduction. Adding for the extra inventory cost should be performed due to supplier and source limitation. On the other hand, the priority for leverage item is cost reduction concern. Several suppliers available in the market can enhance the buyer power to create competition atmosphere among the supplier in order to lowering the unit cost as much as possible.

2.4 Conclusion

Purchasing department is not concerned as a support department. It is concerned as a strategic department dealing with cost of company. To have a good result in company financial performance, it is significantly relied on how well purchasing and supply management operation in terms of supplier management, cost functional integration, strategy development, human resource management, purchasing and supply control. In order to improve the purchasing efficiency in terms of risk and cost reduction, the company can apply the four stages approach. Firstly, purchased raw material must be classified. It can be classified based on purchased volume, percentage of total purchase cost or business growth. Secondly, performing the market analysis by using Five Force Analysis as a helping tool, this can give the result in terms of the qualitative or/and quantitative. Thirdly, performing the strategic positioning, this can located the item positioning in order to apply the proper strategy. Normally, the supply positioning model and purchasing portfolio matrix can be used in this stage. By plotting risk score versus expenditure in supply positioning model, the product position can be known. For the purchasing portfolio analysis, power of buyer versus power of supplier can be plotted in order to know the relative power between buyer and supplier. Finally, the action plan can be created to each selected raw material by using the analyzed information from the previous phases.

Hence, by proper analyzing the product position along with observe from the current problem situation, the worker can create the right strategy to the right item. This can improve the purchasing efficiency in terms of risk management and cost reduction both short term and in the long run.

CHAPTER III

PRELIMINARY STUDY

This chapter describes about the raw material analysis. Five force analysis is a main tool for analyzing the current situation of each raw material especially for the company risk impact. In order to be more concrete in terms of risk analysis, quantitative measurement is defined as a risk value number. These risk values along with other analyzed information can be one of the significant data for locating raw material position in the supply positioning model and purchasing portfolio model respectively.

3.1 Purposes

The preliminary study was created and conducted in order to satisfy the following purposes:

1).To analyze the market current situation by using five force analysis model in order to know the risk score value

2). To classify raw material position by using supply positioning model along with purchasing portfolio matrix in order to apply the proper strategy to each raw material

3.2 Objectives

The major objectives of the preliminary study are following.

1). To rank raw material expenditure into three different classes by using Pareto analysis and select the class that needs to focus

2). To analyze the current market situation in five different aspects which are competitive rivalry within an industry, threat of new entrances, threat of substitute material, bargaining power of supplier and bargaining power of buyer in order to know the risk score value as a result

3). To classify the raw material position in term of supply risk versus relative expenditure into four different groups which are strategic, bottleneck, leverage and non-critical in order to apply the proper strategy

4). To compare the power of buyer and supplier in each raw material in order to create proper strategy

3.3 Scope of the preliminary study

The scope of the preliminary will focus on the chemical raw material in class A and top five highest expenditure chemical raw materials from class B which also have high risk in terms of monopoly supplier, long supply chain with high expenditure.

3.3.1 Procedure

The procedure for classify and locate raw material position can be seperated into 4 steps as following.

1.) Apply Pareto Analysis

Using Pareto Analysis based on amount of annual expenditure in order to rank the raw material expenditure from highest to lowest. Those raw materials can be seperated into three classes which are class A (20% of raw material can generate the 80% of expenditure), class B (30% of raw material can generate 15% of expenditure) and class C (50% of raw material can generate 5% of expenditure) as shown in Appendix A.

Due to our scope of research, only chemical raw materials are focused. The highest to lowest expenditure of chemical raw material in class A and top five highest expenditure raw materials from class B which also have high risk in terms of monopoly supplier, long supply chain with high expenditure. The list of selected improving raw materials is following (shows in Table 3.1).

| <i>NO</i> . | MATERIAL LIST | <i>NO</i> . | Amount | Cumulative | % total | Group |
|-------------|---|-------------|------------------|------------------|---------------|-------|
| 1 | TAPIOCA STARCH | 1 | 2,579,602,284.37 | 2,579,602,284.37 | 34.97 | |
| 2 | AMMONIA GAS 100% (NH3) | 2 | 1,003,295,513.25 | 3,582,897,797.62 | 48.57 | |
| 3 | RAW SUGAR | 3 | 670,764,051.40 | 4,253,661,849.02 | 57 .66 | |
| 4 | INOSINE (Note: Will beTerminated) | 4 | 335,203,822.40 | 4,588,865,671.42 | 62.21 | |
| 5 | FUEL OIL "C" | 5 | 302,268,615.43 | 4,891,134,286.85 | 66.31 | |
| 6 | CAUSTIC SODA 32% (NaOH) | 6 | 295,918,639.20 | 5,187,052,926.05 | 70.32 | |
| 7 | SODIUM ACID PYROPHOSPHATE (Note: Will beTerminated) | 7 | 284,003,180.60 | 5,471,056,106.65 | 74.17 | |
| 8 | COAL | 8 | 258,495,703.70 | 5,729,551,810.35 | 77.67 | А |
| 9 | HYDROCHLORIC ACID 35% (HCI) | 9 | 219,808,978.40 | 5,949,360,788.75 | 80.65 | ñ |

Selected raw material from Class A

- Ammonia
- Caustic Soda 32% and 50%
- Coal
- Hydrochloric acid
- Sulfuric acid

Selected raw material from Class B

- Urea
- Potassium Chloride
- Antifoam GD-113
- Succinic acid
- Ammonium Chloride

2). Apply Five Force Analysis

Each selected raw material has to perform the current market analysis. The author applies Five Force Analysis as a helping tool in order to analyze in five different views which are competitive rivalry within an industry, threat of new entrances, threat of substitute material, bargaining power of supplier and bargaining power of buyer in order to know the risk score value as a result. As John F. Rice' publication [25], performing brainstorming session is a potential way to scoring the risk in each force. Hence, the author uses this method to score the risk value in each force. Purchasing manager, division manager, senior supervisor and in charge purchaser have a meeting session and conclude for the average risk score value in each selected raw material as shown in the Appendix B.

2.1) Ammonia (NH₃)

<u>Background</u>

- O The main raw material for producing ammonia is natural gas while the product of ammonia is urea using in the fertilizer industry.
- O This raw material is used in every ABC production plans which are PPD, PPT, KPP and AYT. Its fuction is to provide nitrogen supplied to the ferment bacteria in fermentation production phase.
- O There are two current suppliers which are A Co.,Ltd and B Co.,Ltd supplied ammonia to ABC.
- O In PPD and KPP production plant, the tank owner is A Co., Ltd. Hence, these two plants can receive ammonia only from A Co.,Ltd. However, in PTT and AYT production, ABC is the tank owner. Hence, these two production plants can receive ammonia from both suppliers.
- O It is concerned as a highest expenditure of chemical raw material in class A.
- O The risk score values from Five Force Analysis are shown in the Table 3.2 to Table 3.6.

| Force 1: Competitive Rivalry within an Industry | | | | | | | |
|---|---|------------------|-----------------------|---------------------|----------------------|------------------------|----------------------|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Scor |
| | - 6-10 Ammonia's traders in Thailand with total import volume approximately 600,000 MT/year | External | 2 | 2 | 2 | 2 | 2.00 |
| Number of supplier | Only two suppliers with same sources supplying this raw material | Internal | 4 | 3 | 3 | 4 | 3.50 |
| Growth rate of Ammonia Business | - Growth rate of Ammonia business is around 4.86% YoY | External | 3 | 3 | 3 | 3 | 3.00 |
| | In some production plant, the Ammonia facility tank is invested by specific supplier. Hence, it is limited in term of supply due to the contract. | Internal | 4 | 4 | 4 | 4 | 4.00 |
| | Total Average Risk Sco | ore | | | | | 3.13 |

Table 3. 2: Competitive Rivalry within an Industry (Force 1)

| Table 3. 3: Threat of New Entrances (Force 2 | 2) |
|--|----|
|--|----|

| Force 2: Threat of New Entrances | | | | | | | |
|---|--|------------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score |
| Capital requirements | Require high standard of storage tank system and transportation safety devices | External | 4 | 4 | 4 | 4 | 4.00 |
| Special skills | - Require a specific safety and operation training | External | 4 | 4 | 4 | 4 | 4.00 |
| Market defensive from current ABC supplier | - It is quite high competition in order to enter to supply Ammonia to ABC due to the tank owner. | Internal | 4 | 4 | 4 | 4 | 4.00 |
| Cash flow | - The cash flow in each shipment is very high with vary transportation sizes between 560 to 1,496 MT per shipment. | External | 4 | 4 | 4 | 4 | 4.00 |
| | Total Average Risk Sco | ore | | | | | 4.00 |

Table 3. 4: Threat of Substitute Material (Force 3)

| | Force 3: Threat of Subs | titute Mate | rial | | I | I | I |
|------------------------------------|--|------------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score |
| Alternative material | - Urea can be used as an alternative product of Ammonia because it is also contained the nitrogen component and concerned as a commercial product. | External | | 3 | 4 | 4 | 3.75 |
| Switching Cost | - There is low switching cost in PPD and AYT production plant while high switching cost in PTT and KPP production plant because there are no dissolving tanks in these two factories. | Internal | 4 | 4 | 3 | 3 | 3.50 |
| Pricing of alternative material | - Because urea is concerned as a commercial product so,price can be predictable and competitive than Ammonia in some period. | External | 4 | 4 | 4 | 4 | 4.00 |
| | Total Average Risk Sco | ore | | | | | 3.75 |

| Force 4: Bargaining power of supplier | | | | | | | |
|---------------------------------------|--|------------------|-----------------------|-----|----------------------|------------------------|-----------------------|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | | Senior Supervisor | In charge Purchaser | Average risk Score |
| Supplying source | - The main raw material for producing ammonia is natural gas with several supply sources. | External | 2 | 2.5 | 2 | 2 | 2.13 |
| Availability of natural gas | - There is high avalibility for supply Natural gas especially in Middle East | External | 2 | 2 | 2 | 2.5 | 2.13 |
| Supplier supply chain | - Due to large and global standard company, supplier can well manage their supply chain. However, quantity of Ammonia supply is depended on urea demand in some of period (fertilizer season). | External | 3 | 3 | 3.5 | 3 | 3.13 |
| | Total Average Risk Sco | ore | • | | • | • | 2.46 |

| Table 3. 5: | Bargaining | Power | of Supplier | (Force 4) |
|-------------|------------|-------|-------------|-----------|

|----------------------------|--|------------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|--|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score | |
| Switching cost | - There is high switching cost for switching supplier because high cost of installation a new tank and special operation, storage and transportation. | Internal | 4 | 4 | 3.5 | 4 | 3.88 | |
| Supply limitation | - It is limited in term of tank facility in PPD and KPP production plan. Hence, only Unique gas supplier can supply for these two plants. | Internal | 4 | 4 | 4 | 4.5 | 4.13 | |
| Potential Supplier | - There are less potential suppliers supplied Ammonia to ABC. | Internal | 3 | 3.5 | 2.5 | 3 | 3.00 | |
| | Total Average Risk Sco | ore | - | | | | 3.67 | |

2.2) Caustic Soda 32% (32%NaOH) and Caustic Soda 50% (50%NaOH)

2.3) Hydrochloric acid 35% (35%HCl)

<u>Backeroud</u>

- O Because Caustic Soda 32% (32%NaOH), Caustic Soda 50% (50%NaOH) and Hydrochloric acid 35% (35%HCl) have same market and supply situation. Hence, they can be simultaneous analyzed.
- O Caustic Soda 32% is in rank 2 of class A chemical raw material. This costs 295,918,639.20 THB per annual. Caustic Soda 50% is in rank 5 of class A chemical raw material with cost 185,142,824.00 per annual.
- O Hydrochloric acid also uses in every ABC production plants. It is in rank 4 of chemical raw material. This costs 219,808,978.40 THB per annual.

O The risk score values from Five Force Analysis are shown in the Table 3.7 to Table 3.11.

| | Force 1: Competitive Rivalry within an Industry | | | | | | | |
|----------------------|---|---------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|--|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score | |
| Number of supplier | - There are limited in local manufacturers, only 6 plants in Thailand. | External | 4.5 | 4.5 | 4.5 | 4.5 | 4.50 | |
| Number of supplier | - There are 4 suppliers supplied this raw material to ABC. | Internal | 3.5 | 3.5 | 3.5 | 3.5 | 3.50 | |
| Business growth rate | - With high customer demand of chlor- akali, the growth rate of this business is high. However, caustic soda and hydrochloric acid production is relied on each other due to co-product. For example, with high demand of caustic soda and low demand of hydrochloric acid, to increase production rate of caustic soda is limited by hydrochloric acid. | External | 4 | 4 | 4 | 4 | 4.00 | |
| | Total average ris | k score | | • | | • | 4.00 | |

2.4) Coal

<u>Background</u>

- O Coal is used as steam energy for co-generator in PTT factory.
- O There are 7 current approved suppliers.
- O It is in rank 3 of chemical raw material with 258,495,703.70 THB per annual.
- O The cost of this raw material comes from two parts. The first is the cost of coal itself. The second part is ash treatment cost.
- O The nature of coal is not concerned as a chemical raw material. However, it is also responsible by chemical purchasing team so, coal is also classified as a chemical raw material in this thesis
- O The risk score values from Five Force Analysis are shown in the Table 3.11 to Table 3.15.

| Force 1: Competitive Rivalry within an Industry | | | | | | | |
|---|--|---------------|------------------------|---------------------|----------------------|------------------------|-----------------------|
| Consideration Point | Current Situation | Impact Factor | Purchasing Mangager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score |
| Number of supplier | - There are several coal suppliers in Thailand. | External | 2 | 2 | 2 | 2 | 2.00 |
| Number of supplier | ABC also has many approved suppliers (7 vendors). | Internal | 2 | 2 | 2.5 | 2 | 2.13 |
| Thailand coal market | Coal business is continuously growth because of its competitive price when compare to Fuel oil. | External | 2 | 1.5 | 2 | 2 | 1.88 |
| Policy and control | - With environmental concern, coal business might be prohibited to construct stockpile in vicinity to the community area. | External | 4 | 4 | 4 | 4 | 4.00 |
| | Total average risk | score | | • | • | | 2.50 |

Table 3. 12: Competitive Rivalry within an Industry (Force 1)

| Table 3. 13: Threat of New Entrances (Force 2) |

|--|

| | Force 2: Threat o | of New Entrance | S | | | | |
|--|--|-----------------|------------------------|---------------------|----------------------|------------------------|-----------------------|
| Consideration Point | Current Situation | Impact Factor | Purchasing Mangager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score |
| Capital Investment | - High investment in term of transportation, stockpile, crusher and sieving machine including environmental pollution concern | External | 3 | 3.5 | 3 | 3 | 3.13 |
| Cash flow | - Due to huge volume of each shipment (10,000-100,000T), high cash flow will be involved which is around 24 million THB per shipment. | External | 3 | 3 | 2.5 | 3 | 2.88 |
| Market defensive | -There are several coal businesses in Thailand hence, it might be difficult for new entranes to make brand and famous in this business field. | External | 3 | 3 | 3 | 2.5 | 2.88 |
| Market defensive of ABC current supplier | - ABC highly concerns about coal quality and there are also several approved suppliers in hand. Hence, it might be difficult to enter to ABC. | Internal | 3 | 2 | 3 | 3.5 | 2.88 |
| | Total average ris | k score | RGIT | V | - | | 2.94 |

Table 3. 14: Threat of Substitute Product (Force 3)

| | Force 3: Threat of Substitute Product | | | | | | | | | |
|------------------------------------|--|---------------|-----------------------|---|----------------------|------------------------|-----------------------|--|--|--|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | | Senior Supervisor | In charge Purchaser | Average risk Score | | | |
| Available of substitute product | - Fuel oil can be an alternative material for coal. | External | 2 | 2 | 3 | 2.5 | 2.38 | | | |
| Switching cost | - It takes high switching cost due to different boiler specification between coal and fuel oil. However, fuel oil is high price when compare with coal price. | External | 3 | 3 | 2.5 | 3 | 2.88 | | | |
| | Total average risk | score | | | | | 2.63 | | | |

| | Force 4: Bargaining Power of Supplier | | | | | | | | | | |
|---|---|---------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|--|--|--|--|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score | | | | |
| Supply source | - There are more than 100 coal sources in the global. However, the major supply source in Asia is from Indonesia. | External | 2 | 2 | 2 | 2 | 2.00 | | | | |
| Supplier supply chain | - Traders have a good relationship with supplier. Normally, they perform contract with supplier as a long term contract. | External | 2 | 2.5 | 2 | 2 | 2.13 | | | | |
| Cost of switching sources and suppliers | Because there are plenty of available sources and suppliers, the switching cost is low. | External | 2 | 2 | 1.5 | 2 | 1.88 | | | | |
| | Total average risk | score | | | | | 2.00 | | | | |

Table 3. 15: Bargaining Power of Supplier (Force 4)

Table 3. 16: Bargaining Power of Customer (Force 5)

| | Force 5: Bargaining Power of Customer | | | | | | | | | |
|----------------------|--|---------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|--|--|--|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score | | | |
| ABC bargaining power | - ABC uses high volume of coal per day (330 MT/day) but requires specific size which is 5-10 mm. with highly quality concern. Hence, the bargaining power is moderate. | Internal | 3 | 3 | 2.5 | 2 | 2.63 | | | |
| ABC switching cost | - The switching cost for changing supplier is low. | Internal | 2 | 3 | 2.5 | 2.5 | 2.50 | | | |
| | Total average risk | score | | | | | 2.56 | | | |

2.5) Sulfuric acid 98% (98% H₂SO₄)

<u>Background</u>

- O Sulfuric acid is used in every ABC production plant (PPD,PTT,KPP and AYT).
- O It is used for adjust pH in order to crystallized glutamic.
- O There are five approved current vendors supplied this raw material to ABC.
- O The annual expenditure is 134,894,093.80 THB with rank number 6 of chemical raw material in class A.
- O The risk score values from Five Force Analysis are shown in the Table 3.17 to Table 3.21.

| Table 3. 17: Competitive | Rivalry within an | Industry (Force1) |
|--------------------------|-------------------|-------------------|
|--------------------------|-------------------|-------------------|

| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Scor |
|------------------------------|---|---------------|-----------------------|---------------------|----------------------|------------------------|----------------------|
| Number of supplier | - There are several import traders and local makers supplied this material. | External | 2 | 2 | 2 | 2 | 2.00 |
| Number of supplier | - ABC has five approved vendors supplied this raw material. | Internal | 2 | 2.5 | 2 | 2 | 2.13 |
| Growth rate in this business | - The growth rate in this business is quite high. | External | 2 | 2 | 1.5 | 2 | 1.88 |
| | Total average risk so | ore | • | • | | | 2.00 |

Table 3. 18: Threat of New Entrances (Force 2)

| | Total average risk s | core | • | • | • | | 2.67 | | |

2.6) Urea 46% (46% CO(NH₂)₂)

<u>Backgroud</u>

- O Urea can be use as an alternative of Ammonia. This is because there is also avaliable of nitrogen containment approximately 44-46%. However, ABC uses urea with a few ratio when compare with ammonia even urea is more competitive price in some period.
- O Its fuction is to provide nitrogen soure supplied to ferment bacteria in fermentation production phase.
- O There is only one supplier supplied urea to ABC.
- O It is concern as highest expenditure of chemical raw material in class B. The urea expenditure per annual is 75,801,334 THB.
- O The risk score values from Five Force Analysis are shown in the Table 3.22 to Table 3.26.

| Force 1: Competitive Rivalry within an Industry | | | | | | | | |
|---|---|---------------|-----------------------|---------------------|----------------------|------------------------|-----------------------|--|
| Consideration Point | Current Situation | Impact Factor | Purchasing Manager | Division Manager | Senior Supervisor | In charge Purchaser | Average risk Score | |
| Number of supplier | - There are several suppliers with many supply sources such as Indonesia, Malaysia and Middle East imported Urea to Thailand. | External | 2 | 2 | 2 | 2 | 2.00 | |
| | - There is only supplier supplied this raw material to ABC. | Internal | 5 | 4.5 | 4.5 5 5 | 5 | 4.88 | |
| Import Volume | - Urea import volume quite stable. It is approximately 2 million MT imported Urea per annual. | External | 2 | 2 | 2.5 | 2 | 2.13 | |

2.7) Potassium chloride (KCl)

<u>Background</u>

- O Potassium chloride is used in every ABC plant.
- O There is monopoly supply from one supplier with single source.
- O It is in rank 2 of class B chemical raw material. It costs 48,574,544.00 THB per annual.
- O The risk score values from Five Force Analysis are shown in the Table 3.27 to Table 3.31.

| | Force 1: Competitive Riva | lry within an In | dustry | | | | | | | | |

In summary, there are 10* chemical raw materials are selected to analyze and perform purchasing improvement. Some of raw material such as 35%, 50% caustic soda and 35% hydrochloric acid, antifoam GD-113 and succinic acid have the same supply nature and market situation hence, they can simultaneously analyse and result in the same average risk score value. In this report, the raw material that has average risk score <3 is concerned as low risk. For the raw material that has average risk score >3 is concerned as high risk. As the table 3.42 shows, there are 8 raw materials concerned as high risk and only 2 raw materials concerned as low risk. (*32% caustic soda and 50% caustic soda are classified as one raw material due to same chemical composition. There is only different in concentration.)

| Name of Raw material | Average Risk Score Value | | | | | |
|-----------------------------|--------------------------|--|--|--|--|--|
| Class A | | | | | | |
| 1. Ammonia | 3.40 | | | | | |
| 2. 35% and 50% Caustic Soda | 3.00 | | | | | |
| 3. 35% Hydrochloric acid | 3.00 | | | | | |
| 4. coal | 2.53 | | | | | |
| 5. 98% Sulfuric acid | 2.33 | | | | | |
| Class B | | | | | | |
| 6. 46% Urea | 3.14 | | | | | |
| 7. Potassium Chloride | 3.43 | | | | | |
| 8. Anitifoam GD-113 | 3.53 | | | | | |
| 9. Succinic acid | 3.53 | | | | | |
| 10. Ammonium Chloride | 3.23 | | | | | |

Table 3. 42: The summary table of average risk score value in each selected chemical raw material from class A and class B

3). Apply Purchasing Portfolio Matrix

In order to know the power of purchaser compared with the power of supplier, the purchasing portfolio matrix is applied. The analysed information in the five force analysis is used for locating the items' position. There are 3 classified areas in the purchasing portfolio matrix. The first area is explicit. In this area, the power of purchaser trends to be more than power of supplier. The raw materials that are classified in this position are coal and sulfuric acid. The second classified area is balance. In this area, the power of purchaser and power of supplier trend to be equivalent to each other. There are caustic soda and hydrochloric acid located in this area. Lastly, diversify area, the power of supplier trends to be higher than power of purchaser. The raw materials in this area antifoamGD-113 as shows in Figure 3.1.

Knowing the purchasing power between power of purchaser and supplier can help the purchaser to create the right strategy for performing the contract with supplier. For example, the raw materials which are in the exploit area should maximize the purchaser power as much as possible and create high competition among the suppliers to lowering the unit cost. On the other hand, the raw materials which are located in the diversify area should compromise and make a good relationship with supplier, long term contract is

| | | Power of Supplier | | | | | | |
|--------------------|---------|----------------------|-----------------------------------|-------|--|--|--|--|
| | | Low | Average | High | | | | |
| er | High | Coal Sulfuricacid | | | | | | |
| Power of Purchaser | Average | | Caustic Soda Hydrochloric acid | - | Ammonia ium Chloride um Chloride | | | |
| | Low | | | Succi | nic GD-113 | | | |

preferable. However, after applying new strategy, the raw material position can be changed.

4). Apply Supply Positioning Model

After using five force analysis, the risk score value of each raw material can be known. The risk score from five force analysis along with annual expenditure from pareto analysis can plot raw material position in a supply positioning model. Class B or class C raw materials with risk score \leq 3 are located in routine position. However, in this reserch, there are no raw matierials classified as routine. Class B or class C raw materials with risk score > 3 are located in the bottleneck position. There are urea, succinic acid, antifoam-GD-113, potassium chloride and ammonium chloride located in this position. Class A raw materials with risk score \leq 3 are located in leverage position. There are coal and 98% sulfuric acid located in this position. Lastly, class A raw materials with risk score value >3 are classified in the critical postion. There are ammonia, 32%,50% caustic soda and 35%hydrochloric acid in this positionas shown in Figure 3.2.

Knowing the raw material position in the supply positioning model, purchaser can create the proper strategy to each raw material. For example, the material with high risk such as bottleneck and critical position, the purchaser can lower the risk by increasing bargaing power, find alternative raw material and etc. This is not only reduce the risk but also reduce the unit cost as well. After applying the strategy, the raw material position can be changed.

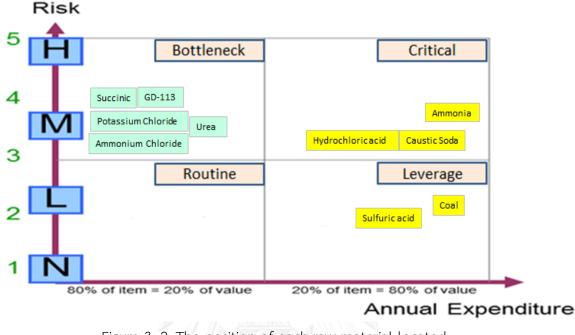

Figure 3. 2: The position of each raw material located in the supply positioning model

3.4 Conclusion

Preliminary study is conducted in order to know scope and select the raw materials that needed to be improved. Firstly, using the Pareto analysis in order to rank raw material from the highest to lowest annual expenditure, the list of raw materials can be classified into three classes which are class A, B and C. Then, scoping the improved raw material, chemical raw material from class A along with top five expenditure of chemical raw material from class B that also have high risk in terms of monopoly supplier, long supply chain with high expenditure are selected to improve. Secondly, using Five Force Analysis as a helping tool to analyze the current market and supply situation. There are five different aspects that needed to be considered. In order to be more concrete, the author attempts to measure as a quantitative way by assigned risk score value in each analyzed issue and calculated for average value. Thirdly, Purchasing Portfolio Matrix is applied by using the analyzed information from Five Force Analysis. This matrix informs about the relative power between buyer and supplier of each selected raw material. Lastly, the risk scores from Five Force Analysis along with annual expenditure from Pareto analysis can locate raw material in Supply Positioning model in order to know the raw material classification. Those selected raw material can be located and separated into 4 different groups which are critical, bottleneck, leverage and non-critical. Ammonia, 35%, 50% caustic soda, 35% hydrochloric acid are located in critical position which concerned as high expenditure along with high risk items. Urea, antifoam GD-113, succinic acid and ammonium chloride are located in bottleneck position which concerned as low to medium expenditure with high risk. Coal and 98% sulfuric acid are located in leverage position which concerned as high expenditure as high expenditure with high risk. Coal and 98% sulfuric acid are located in leverage position which concerned as high expenditure with low risk. However, there are no selected raw materials that are classified as routine. After knowing the position in terms of risk, expenditure along with buyer and supplier relative power, the proper strategies can be created to each of selected raw material in the next chapter.

CHAPTER IV

BUSINESS STRATEGIES DEVELOPMENT

After analyzing the raw material position in supply positioning model along with purchasing portfolio matrix, the major strategies are created to improve the purchasing scheme to each raw material. The major improvement strategies are relied on the position that each raw material is located.

This chapter consists of operational plan and strategies for improving the raw material purchasing scheme. First, the root causes of price and supply risk are analyzed. Next, the improvement plans for strategic, leverage and bottleneck raw material are created. Finally, the operational team is set in order to cooperate and perform this improvement project. The included topics are followings.

4.1 Root Cause Analysis

4.1.1 Not conforming between purchasing contract price and market price

4.1.2 Supply risk creating raw material shortage

4.2 Improving Planning

4.2.1 Strategic raw material

- 4.2.2 Leverage raw material
- 4.2.3 Bottleneck raw material

4.3 Operational Team in Improvement Planning

4.4 Conclusion

4.1 Root Cause Analysis

The main root cause for inefficiency in terms of the purchasing and supply management can be classified into two main causes. The first cause is not conforming price for the purchasing contract price or high purchasing price when compared with market price. The second cause is supply risk that can create shortage of raw material. Those two causes are analyzed by using a fishbone diagram as shown in Figure 4.1 and Figure 4.2.

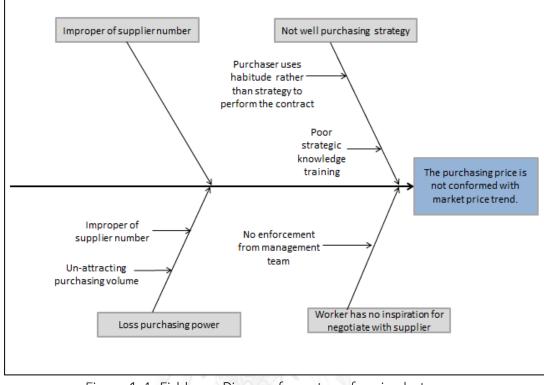

Figure 4. 1: Fishbone Diagram for not conforming between purchasing price and market price trend

4.1.1 Not conforming between purchasing contract price and market price

1) Improper of supplier number

Too much supplier or too less supplier can affect to the bargaining power. Some raw material that concerned as leverage items may need high competition in order to biding for the offer price. Finally, only 2-3 suppliers with lowest price may choose for that contract. On the other hand, the item that concerned as bottleneck may have a few suppliers available in the market hence searching for the second source in order to reduce risk is important more than price concern.

2) Not well purchasing strategy

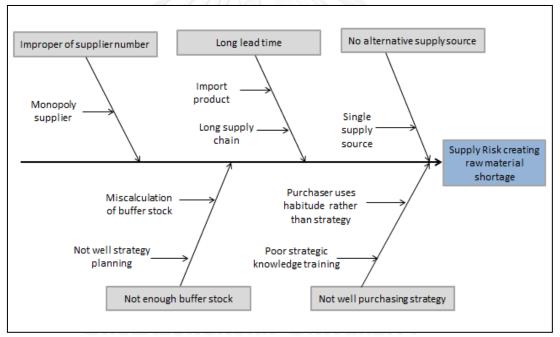

When performing the contract, purchaser uses their habitude rather than purchasing strategic along with no proper training about purchasing strategy. Hence, the contract might be higher than the market price.

3) Loss purchasing power

Too much supplier per each contract can reduce the purchasing power because the purchasing volume needs to be more separated and allocated to each supplier. With less volume, it may not attract to the supplier.

4) Worker has no inspiration for negotiating with supplier

With no enforcement from the management team along with no clear target, this may bring about the worker has no inspiration for negotiation with supplier and creation the project.

4.1.2 Supply risk creating raw material shortage

Figure 4. 2: Fishbone Diagram for supply risk creating raw material shortage

1) Improper of supplier number

Having only one supplier, it may increase risk for the raw material shortage. If the supplier suffers from the financial problem, production problem or any other accidents, the buyer company will suffer from raw material shortage because of no back up supplier.

2) Long lead time

Having long supply chain especially for the import raw material, this can create high risk to the company such as not on time delivery and raw material contamination.

3) No alternative supply source

Having only one supply source, the company may take high risk in case there are wrong product specification, plant shut down and etc.

4) Not enough buffer stock

Not well strategic planning along with miscalculation for the buffer stock, this can create raw material shortage in case underestimate buffer stock. On the other hand, overestimate in buffer stock can increase the warehouse cost and expiry of raw material.

5) Not well purchasing strategy

By not having a good training for the purchasing knowledge, the purchasers may not concern for the supply risk aspect. He/she might only concern for the contract price. This can halt the production process because of no input raw material creating loss of business opportunity.

4.2 Improvement Planning

4.2.1 Strategic raw material

- Ammonia
- 35%,50%Caustic Soda
- 35% Hydrochloric acid

Priority target: Reduce Supply Risk and contract price

Scenario 1: Moving down the supply risk position from strategic position to leverage position

OR Scenario 2: Same position with improved purchasing plan and strategy

Major applied strategies:

- Develop long term supply relationships
- Find alternative product
- Create competition atmosphere to lower the unit price

Develop long term supply relationships

For Ammonia, there are a few potential numbers of suppliers available in the market. Hence, perform long term contract with potential supplier is performed in order to lower the company's risk.

Find alternative product

In order to minimize the supply risk, alternative product should be searched and abled to use in the production line. This is not only reducing the risk but also creating competitive to the company when the price of major product is rising. The alternative product of Ammonia, Caustic Soda and Hydrochloric acid are Urea, Soda Ash and Sulfuric acid respectively.

Create competition atmosphere to lower the unit price

Mostly, the alternative products (urea and sulfuric acid) are concerned as commercial product and standard specification. Hence, there are several traders with high supply volume available in the market. Hence, biding for the price or E-auction can apply. Supplier with lowest offer price is chosen to perform the contract. This can create competition atmosphere and lower the unit price.

4.2.2 Leverage raw material

- Coal
- 98% Sulfuric acid

Priority Target: Reduce average price

Scenario 1: Moving the relative expenditure from leverage position to noncritical position

OR Scenario 2: Same position with improved purchasing plan and strategy Major applied strategies:

- Vendor Selection
- Target pricing strategies and negotiations
- Order volume optimization
- Exploration of full purchasing power

Vendor selection

Performing vendor selection or apply vender optimization strategy in order to optimize the number of supplier in each contract, this can increase the buyer bargaining power. However, buyer has to concern about the truck capacity, flexibility to service in an urgent order along with buffer stock as well.

Target pricing strategies and negotiations

Coal and sulfuric acid are commodity products with identity of specification. Hence, choosing supplier with the lowest price is main target strategy for leverage product. Supplier who can offer the most competitive price will receive high volume portion. This can create the competition atmosphere among the suppliers.

Order volume optimization

The volume allocation to each supplier will depend upon the offer price. Supplier who offers the lowest price will receive high volume in that contract and vice versa to who offer for the higher price. In order to optimize the volume allocation, buyer has to concern about the capacity of truck. With maximize the volume to fulfill each truck can minimize the transportation cost. For example, the coal truck size is 30 MT per truck. For sulfuric acid uses trailer with 24 MT per truck. The buyer should allocate the volume to each supplier by divisibly to truck capacity.

Exploration of full purchasing power

By apply vendor optimization strategy; buyer will have more power to negotiate for the unit price. The buyer might limit the number of time to offer the unit price from each supplier such as three times per vendor. Those who offer noncompetitive price might be eliminated to that contract. This can fully create the competitive atmosphere among the suppliers.

However, E-auction might not suitable for applied to these two items because of supplier and product nature. For coal, the product specification is highly concerned such as moisture, heat value and etc. Hence, the supplier that offers the lowest price does not ensure for the best product quality. SGS analysis certification from independent verification service company is required in order to inspect for the product quality as well. For sulfuric acid, the business sizes are different among the supplier. Some vendors have plenty of service trucks. Some have limited truck sizes and numbers. The one who offers the lowest price might not have enough capacity to supply. Therefore, verbal bidding and negotiation are more suitable than Eauction.

4.2.3 Bottleneck raw material

- 46% Urea
- Potassium Chloride
- Antifoam GD-113
- Succinic acid
- Ammonium Chloride

Priority target: Reduce supply risk

Scenario 1: Moving down the supply risk position from bottom-neck position to noncritical position

OR Scenario 2: Same position with improved purchasing plan and strategy

Major Applied Strategies:

- Find more vendors
- Security of inventories
- Perform long term contract

Find more vendors

Normally, the bottleneck items have monopoly supplier, or single source supply. Hence, it is risk in terms of supply in case there is no product available or suppliers might terminate their business. Currently, all of the raw materials that are located in this position have only one supply supplier. Hence, find alternative sources and vendors are needed.

Security of inventories

Some raw material is imported with longer lead time when compared to the domestic purchase. The buffer stock should be set and available in case there is no supply raw material. The direct imported raw materials are Antifoam GD-113 and Succinic acid.

Perform long term contract

Long term contract is preferable especially for the import product. By perform the yearly contract instead of monthly, the overseas manufacturer can well plan their production schedule along with well manage their raw material and reduce supply risk.

4.3 Operational Team in Improvement Planning

In order to achieve the improvement project, relevant department especially production department and purchasing department are needed for simultaneously cooperative developing the procurement improvement project. The major meeting schedule is described in the Table 4.1 below.

| Session | Month | Participant | Details |
|-----------------------------|--------------|--|--------------------------------|
| One: Apply alternative raw | | 1. Project team member | -Purchasing team discusses |
| material discussion session | | 2. Project leader | with production deparment |

| | | | power. |

Table 4. 1: Detail of Meeting Session

4.4 Conclusion

This chapter describes the improvement plans and strategies to each raw material. There are two major problems which are relevant to price and supply risk. Firstly, Fishbone Diagram is applied in order to analyze the root cause of not conforming between purchasing contract price and market price, and supply risk creating raw material shortage. Secondly, the strategies are created to each raw material based on supply position in the supply positioning model. The main strategy for the bottleneck is to lower the supply risk. The strategy for the leverage is to lower the unit price while the strategies for the critical raw materials are not only lower supply risk but also lower the unit price. Thirdly, cooperative with production team is very significant. The cooperated discussing between purchasing and production department can analyze the possibility for applying alternative raw materials using in the production line.

CHAPTER V

IMPROVEMENT AND IMPLEMENTATION

This chapter describes about the improvement plans and results after applying to each selected raw material. The improvement procedures and applied strategies can be classified into three categories which are strategic raw material, leverage raw material and bottleneck raw material based on supply position as following.

5.1 Strategic raw material

- 5.1.1 Ammonia
- 5.1.2 32%, 50% Caustic Soda
- 5.1.3 35% Hydrochloric acid
- 5.2 Leverage raw material
 - 5.2.1 Coal
 - 5.2.2 98% Sulfuric acid
- 5.3 Bottleneck raw material
 - 5.3.1 Urea
 - 5.3.2 Potassium Chloride
 - 5.3.3 Antifoam GD-113
 - 5.3.4 Succinic acid
 - 5.3.5 Ammonium chloride
- 5.4 Conclusion

5.1 Strategic raw material

5.1.1 Ammonia

Applied strategies

- Find alternative raw material

- Find breakeven point formula between main raw material and alternative
- Create competition atmosphere in order to lowering the unit price

<u>Procedure</u>

1). Cooperate with production department in order to find an alternative raw material which gives the nitrogen source as same as Ammonia

1.1 Find alternative raw material

As below chemical reaction shows, enzyme urease which is already available in the fermentation process can change urea to be ammonia providing nitrogen source as same as using ammonia *Enzyme Urease*

$$(NH_2)_2CO + H_2O \longrightarrow 2NH_3 + CO_2$$

1.2 Advantage and disadvantage point analysis

In terms of production

Because both ammonia and urea can provide nitrogen to the process hence, they can be an alternative to each other. However, ammonia is liquid which can promptly use in the process while urea is solid chemical. It is required to dissolve in the dissolve tank before using in the process. However, it takes only a few dissolvent time so, it is not significant affected to the production time.

In terms of sourcing and purchasing

The nature of the market price of these two alternative products is different. For example, ammonia market price of this month comes from the average price of every single day from previous month. Hence, to offer the urea price, supplier has to wait until the end of the month. For urea, the price is depended on the fertilizer usage and crop seasoning. When it is not in the crop season, the price is low. Hence, trader can make their stock at this low price. 2). Find breakeven point formula in order to know the equivalent price between main raw material and alternative

2.1 Break Even Point Formula Calculation of Ammonia (NH₃) and Urea (CH₄N₂O)

Mole of nitrogen (N) calculation

100% of NH₃ = $\frac{14}{17} * 1 = 0.82$ (NH₃ molecular weight is 17 g.)

100% of Urea = $\frac{28}{60} * 1 = 0.46$ (Urea molecular weight is 60 g.)

Assume: The price of $NH_3 = X Baht/Kg$

```
If mole of nitrogen NH<sub>3</sub>:
Hence mole of nitrogen in CH<sub>4</sub>N<sub>2</sub>O:
0.47 = \frac{x}{0.82} * 0.46
```

After substitution, the equivalent price between NH_3 and CH_4N_2O is following.

```
The urea price = Ammonia price * 0.56
```

3). Find urea suppliers in order to bid among each other and compare with ammonia price

4). Performing the contract by allocating the larger portion to competitive price raw material

4.1 Calculating the equivalent price

By referencing from the offer price of ammonia (April 2014) = 23,650 THB/MT

The equivalent of urea price = 23,650 * 0.56 = 13,244 THB/MT

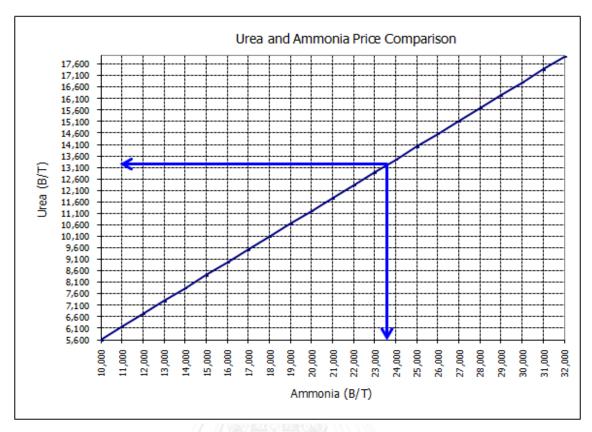

Figure 5. 1: Urea and Ammonia Price Comparison (equivalent price)

By using breakeven point formula or graphing as Figure 5.1 to calculate the equivalent price, urea is more competitive. The equivalent urea price is 13,244 THB/MT while there is only 12,300 -12,500 THB/MT of urea offer price. Hence allocate more portion to urea is more competitive.

4.2 Performing the contract

Table 5. 1: Ammonia Contract comparing the price and

| | Ammonia C | ontract for Mar | rch 2014 | Ammonia Contract for April 2014 | | | | |
|---------------|---------------|-------------------------|------------|---------------------------------|-------------------------|---------------|--|--|
| Supplier name | Mar-14 | Contract Volume (MT) | Total cost | Apr-14 | Contract Volume (MT) | Total cost | | |
| A co.,Ltd | 23,600 | 1,750 | 41,300,000 | 23,650 | 1,150 | 27,197,500.00 | | |
| B co.,Ltd | 23,600 | 1,750 | 41,300,000 | 23,650 | 1,150 | 27,197,500.00 | | |
| Т | Total 3,500 | | 82,600,000 | Total | 2,300 | 54,395,000.00 | | |
| | Average price | | 23,600 | Average price | 23, | 650 | | |

volume between March and April 2014

In latest contract, the ammonia price is slightly increasing from previous contract because the purchased ammonia volume is decreasing approximately 34% (from 3,500 to 2,300 MT/month) as stated in the Table 5.1. By substituting ammonia price which is 23,650 THB/MT and multiply by 0.56 in breakeven point formula, the equivalent urea price is 13,244 THB/MT while the actual market price is 12,400 THB/MT. Hence, urea price is more competitive. Then, searching urea suppliers in order to bid for the offer price is performed. At first, there are five vendors come to bid for the quarter 2/2014 price however, only three lowest price vendor are selected as shows in the Table 5.2.

| | Quarter 1/20 | 14 (JanMar.) | Urea Contract: Quarter 2/2014 (AprJun.) | | | | | | | | |
|---------------|--------------|-------------------------|---|--------------------------|-------------------------|-------------------------|------------|--|--|--|--|

| Average price | 14,000 | 600 | | Average Price | 12,400 | | | | | | |

Table 5. 2: Urea Contract price and volume allocation for quarter1/2014 and quarter 2/2014

To do the urea contract, it is slightly different from the ammonia contract. Ammonia contract is performed as monthly due to the fluctuation and unpredictable of market price. On the other hand, urea price trend has a seasonal trend depending on the crop season so the price is predictable. In this period (at the end of March 2014), the urea price is concerned as low and trend to increase in approaching month (quarter2-3/2014). Hence, quarterly contract is chosen rather than monthly. This can fix the contract price avoided the increasing in market price. The average price of urea in quarter2/2014 is significantly decreasing (11%) due to more biding suppliers. This can create higher competition atmosphere. Table 5. 3: Urea versus Ammonia Consumption from

| Urea Vs Ammonia Consumption | | | | | | | | | | | | |

April 2012 – March 2013

As Table 5.3 shows, in the previous day, the using ratio between urea and ammonia is 10:90. Until June 2012, in that month, there is an ammonia shortage situation due to high demand of fertilizer. Ammonia is totally converted to urea by chemical process in order to supply in the fertilizer business field. Hence, ABC has to urgent purchase urea and perform production test whether the process can use urea as an alternative or not. Finally, it is acceptable to use urea hence, the ratio between urea and ammonia in June 2012 is 25:75. However, after the situation subsides and to be normal in September 2012, purchaser still maintains to use urea: ammonia as 10:90 till March 2014 even urea price is more competitive. There is only 5-10% of urea portion. This might not create the significant profit. Hence, in April 2014, purchasing team cooperates with production department perform cost reduction project, the utilization of urea is increased up to 70% due to its competitive price rather than ammonia. There is only 30% of ammonia consumption.

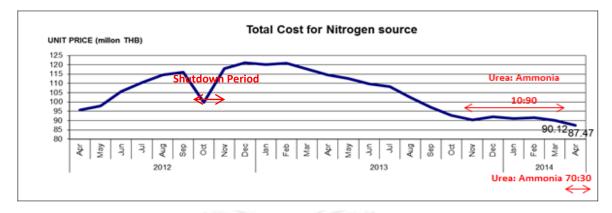

Figure 5. 2: The total cost of Nitrogen Cost from April 2012- April 2014

As the Figure 5.2 shows, after implement urea ratio up to 70% due to its competitive price in this period, the total purchasing cost is reduced from 90.12 to 87.47 million THB with cost merit approximately 2.65 million THB.

In the future contract, the percent ratio might be changed depending upon urea and ammonia market price. By using breakeven point formula, it can be a helping tool to decide the allocation ratio. However, 100% utilization of one raw material might not be suitable even the price is more competitive. This is because maintaining relationship with supplier is also important that has to concern when performing the contract as well.

5.1.2 32% and 50% Caustic Soda

Applied strategies

- Find alternative raw material
- Find breakeven point formula between main raw material and alternative
- Create competition atmosphere in order to lowering the unit price

Procedures

1). Cooperate with production department in order to find an alternative raw material giving the sodium source as same as caustic soda does

1.1 Find alternative raw material

Sodium carbonate or soda ash (Na_2CO_3) can be used as alternative of sodium hydroxide or caustic soda (NaOH). As the following chemical reaction indicated, when caustic soda and soda ash dissolve in water, they can give sodium ion as a product. However, caustic soda can generate only one sodium ion while soda ash can give two sodium ions.

1.2 Advantage and disadvantage point analysis

In terms of production

Soda ash can be used as an alternative of caustic soda because it can generate sodium ion as same as caustic soda does. However, soda ash is normally sold in a solid form while caustic soda is sold in liquid form. Hence, soda ash needs to be dissolved before using in the process.

In terms of sourcing and purchasing

As shows in the Figure 5.3 and Figure 5.4, the market price of caustic soda is fluctuated while the market price of soda ash is stable. Hence, using soda ash can be more predictable in terms of the market price and budget as well.

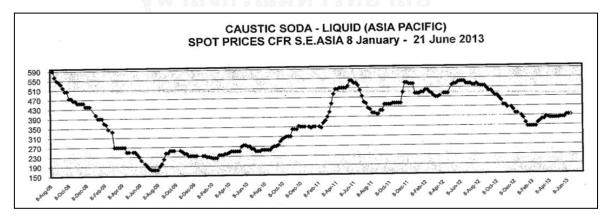

Figure 5. 3: The spot prices of caustic Soda (CER S.E. ASIA) from 8 January – 21 June 2013[29]

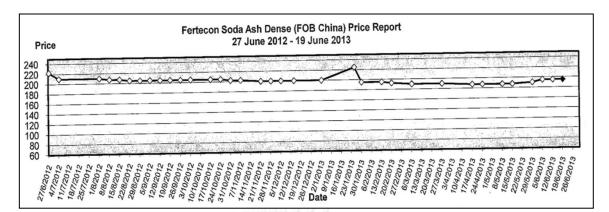

Figure 5. 4: The sort prices of soda ash (FOB China) from 27 June 2012 – 19 June 2013 [30]

2). Find breakeven point formula in order to know the equivalent price between main raw material and alternative

2.1 Break Even Point Formula Calculation of Caustic Soda (NaOH) and Soda Ash (Na₂CO₃)

Mole of sodium (Na) calculation

32% NaOH = $\frac{23}{40}$ * 0.32 = 0.18 (NaOH molecular weight is 40 g.)

50% NaOH =
$$\frac{23}{40} * 0.50 = 0.29$$

100%NaOH =
$$\frac{23}{40} * 1 = 0.57$$

100 %Na₂CO_{3 = $\frac{46}{106}$ * 1 = 0.43 (Na₂CO₃ molecular weight is 106 g.)}

Assume: The price of 32% NaOH = X Baht/Kg

If mole of Sodium in 32%NaOH:

0.18 = X Baht

*Hence mole of Sodium in 100%NaOH:

**Hence mole of Sodium in 100% Na₂CO₃:

After substitution, the equivalent price between Na₂CO₃ and NaOH is following.

 Na_2CO_3 price = 32%NaOH price * 2.34

 Na_2CO_3 price = 50%NaOH price * 1.48

3). Find soda ash suppliers in order to bid among each other and compare the offer price with caustic soda

4). Performing the contract by allocating the larger portion to competitive price raw material

4.1 Calculating the equivalent price

By referencing from the offer price of 32% caustic soda (April 2014) = 4,300 THB/MT

32%Caustic Soda and Soda Ash Price Comparison 15,000 14,500 14,000 13,500 13,000 12,500 12,000 11,500 11,000 Va2CO3 (B/T 10,500 10,000 9,500 9,000 8,500 8,000 7,500 7,000 6,500 6,000 5,500 5,000 66,000 2498999 2498999 32%NaOH (B/T)

The equivalent of soda ash price = 4,300 * 2.34 = 10,148 THB/MT

Figure 5. 5: 32% Caustic soda and Soda Ash Price Comparison (equivalent price)

By using breakeven point formula or graphing as Figure 5.5 to calculate the equivalent price, soda ash is more competitive. Soda ash equivalent price is 10,148 THB/MT while there is only 8,288 THB/MT of soda ash offer price. Hence, allocate more portion to soda ash is more competitive.

4.2 Performing the contract

Because the soda ash price is more competitive, finding more suppliers in order to bid for the price is performed. There are five vendors bidding for the offer price however, only three suppliers with the lowest price are selected. As the Table 5.4 shows, the average price in March 2014 is high when compared with quarter 2/2014 contract price. This is because the order in March is concerned as a trial lot with less volume so the unit price is high. On the other hand, the average price in quarter 2/2014 is dramatically decreasing from 8,600 to 8,288 THB/MT or 3.62% due to more vendors, volume attraction along with high competition atmosphere.

| | Average price | | | | | | Average p | rice | 4,300.00 | |

between Quarter 1/2014 and Quarter 2/2014

By using the breakeven point formula, caustic soda has less competitive price when compared with soda ash. Hence, the volume allocation in quarter 2/2014 is significantly less than quarter 1/2014. Fortunately, by negotiation and in advance inform about alternative raw material project to suppliers, they still maintain the contract price even less caustic soda volume allocation (Table 5.5). However, in this period, there is no

requirement for using 50% caustic soda from production department. Once, the production department requires using 50% caustic soda, the breakeven point formula for comparing the equivalent price with soda ash is also available.

Result and Discussion

Table 5. 6: Comparing Soda Ash and Caustic Soda Utilization Ratio and Total Purchasing Cost in each Month

| | Soda Ash Vs | Caustic Soda Co | onsumption | Convert Na2CO3 to NaOH | Total Volume | Total Cost (Using NaOH | |
|--------|------------------|----------------------|--------------------|------------------------|---|------------------------|---|
| Month | Soda Ash (MT) | Caustic Soda (MT) | Soda Ash %Ratio | Caustic Soda %Ratio | (Eqivalent Consumption Noah : Na2CO3 1 : 0.75) | of Caustic Soda | = 4,300 THB/MT as a reference price) |
| Nov-13 | 0 | 4,200.73 | 0% | 100% | - | 4,200.73 | 18,063,139 |
| Dec-13 | 0 | 4,760.45 | 0% | 100% | - | 4,760.45 | 20,469,935 |
| Jan-14 | 0 | 4,334.57 | 0% | 100% | - | 4,334.57 | 18,638,651 |
| Feb-14 | 0 | 4,059.95 | 0% | 100% | - | 4,059.95 | 17,457,785 |
| Mar-14 | 721.44 | 2,193.06 | 40% | 60% | 962 | 3,154.98 | 13,566,414 |
| Apr-14 | 1,700.00 | 380.00 | 90% | 10% | 2,267 | 2,646.66 | 11,380,638 |

As Table 5.6 shows, by using 100% portion of caustic soda, the total cost is approximately 17—20 million THB. Implementing soda ash as an alternative raw material for reducing risk supply and more competitive price with the ratio 40% in March 2014, the total cost (using same unit price for calculation) is decreasing to 13 million THB. Moreover, by increasing the soda ash portion to 90%, the total cost is decreasing to 11 million. Hence, using 90% portion of soda ash in April 2014, the total cost is dramatically decreasing approximately 6 million baht or 35% decreasing comparing with using 100% portion of caustic soda in February 2014.

5.1.3 35% Hydrochloric Acid

Applied Strategies

- Find alternative raw material
- Find breakeven point formula between main raw material and alternative
- Create competition atmosphere in order to lowering the unit price

<u>Procedures</u>

1). Cooperate with production department in order to find an alternative raw material giving the proton (H^{+}) as same as hydrochloric acid does

1.1 Find alternative raw material

- Find alternative raw material
- Find breakeven point formula between main raw material and alternative
- Create competition atmosphere in order to lowering the unit price
- 1.2 Advantage and disadvantage point analysis

In terms of production

Sulfuric acid can be used as an alternative for hydrochloric acid. It can generate proton (H^{+}) as same as hydrochloric acid does. The chemical reactions are following.

Hydrochloric acid Ionization: HCl (aq) \rightarrow H⁺(aq) + Cl (aq)

Sulfuric acid Ionization: $H_2SO_4 + H_2O \rightarrow HSO_4^- + H_3O^+$

$$HSO_4 + H_20 \leftrightarrow SO_4^{2-} + H_3O^+$$

However, hydrochloric acid which is monoprotic trends to have more corrosiveness rather than sulfuric acid which is diprotic. Using hydrochloric acid can be more corrosive to the pipe line as well as storage tank creating high maintenance cost. Hence, using sulfuric acid as an alternative or substitute raw material can solve this problem.

In terms of sourcing and purchasing

The chlor-akali production is showed in the Figure 5.6. The supply volume of hydrochloric acid in the market is relied on the caustic soda demand. For example, if there is high demand of hydrochloric acid with low demand of caustic soda situation, the chlor-akali's manufacture cannot increase hydrochloric acid production due to limitation of caustic soda demand. This situation can affect to the hydrochloric market price which is unpredictable. On the other hand, sulfuric acid uses sulfur as an only one major raw material. There is no co-product selling in the market hence, the market price can be more predictable when compared with hydrochloric acid.

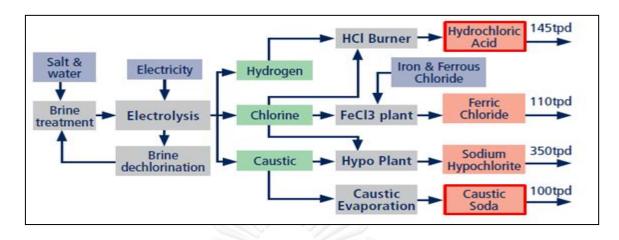

Figure 5. 6: ChlorAkali Production Chart [31]

2). Find breakeven point formula in order to know the equivalent price between main raw material and alternative

2.1 Break Even Point Formula Calculation of Hydrochloric acid (HCl) and Sulfuric acid (H_2SO_4)

Mole of hydrogen (H) calculation

35% HCl =
$$\frac{1}{36.5} * 0.35 = 0.01$$

98% HCl = $\frac{1}{36.5} * 0.98 = 0.027$ (Hydrochloric molecular weight is 36.5 g.)

98% H₂SO₄ = $\frac{2}{98}$ * 0.98 = 0.02 (Sulfuric acid molecular weight is 98 g.)

Assume:

If mole hydrogen in 35% HCl:

0.01 = X Baht

After substitution, the equivalent price between 98%H₂SO₄ and 35%HCl is following.

 $98\%H_2SO_4$ price = 35%HCl price * 2

3). Calculating the equivalent price

By referencing from the offer price of 35% hydrochloric acid (April 2014) = 2,374 THB/MT

The equivalent of 98% sulfuric acid price = 2,374 * 2 = 4,748 THB/MT

By using breakeven point formula to calculate the equivalent price, 98% sulfuric acid is more competitive in this period. 98% sulfuric acid equivalent price is 4,748 THB/MT while there is only 3099.66 THB/MT of sulfuric acid offer price.

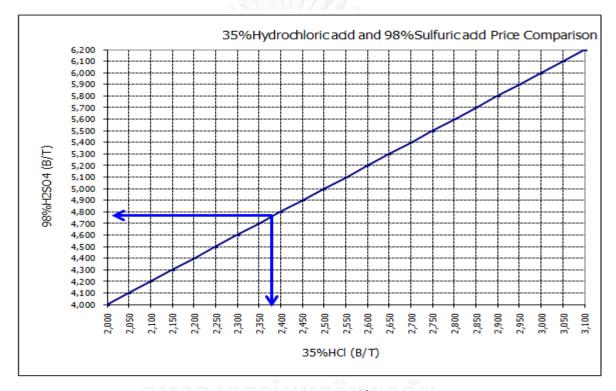

Figure 5. 7: 35% Hydrochloric acid and 98% Sulfuric acid Price Comparison

(equivalent price)

However, hydrochloric acid has a pending contract from January 2014 till June 2014. Hence, it cannot apply alternative raw material which is sulfuric acid to use in the production line even sulfuric acid has more competitive price.

5.2 Leverage raw material

5.2.1 Coal

<u>Background</u>

Normally, there are 6 vendors supplying coal to ABC Company with the coal consumption approximately 330 MT/day. As the Table 5.7 shows, the average price is approximately 2,549.09 THB/T.

| | | | | 2/2014 (| October | -Decem | ber 2014 | 1) | | | | |

Table 5. 7: Coal contract price, coal quality and price ratio for quarter

Applied strategies

- Perform vendor optimization strategy in order to increase bargaining power, create competition among vendors and cost reduction as a target
- Choosing the optimum ratio between high heat and normal heat in order to decrease the using quantity
- Negotiation with supplier that has ash treatment license in order to offer free change of ash elimination service tradeoff with more order volume
- Using price ratio formula as a decision tool in order to weigh not only for the offer price but also quality when performing the contract

Procedures

1). Finding the vendor that has ash treatment license

2). Finding the vendor that has high heat of coal in order to mix this portion with normal heat

3). Cooperation with production in order to find the optimum portion between high heat and normal heat ratio

4). Negotiation with supplier in order to service free ash treatment tradeoff with more contract volume allocation

5). Performing the Q2/2014 contract by applying vendor optimization strategy and using price ratio as a reference.

5.1 Price Ratio Formula

Because heat of coal is significantly factor to concern, with different in heat value can affect to the coal consumption volume. To concern both of the price and coal quality, price ratio formula is created in order to use as a tool for choosing the vendors when performing the contract. The lower value of price ratio indicates the better price and coal quality.

Price Ratio Formula = <u>Heat*(1-%Sulfer-%Moisture-%Ash)</u>

Result and Discussion

The Table 5.8 shows the ratio of normal heat and high heat along with coal consumption and total cost from December 2013 to April 2014. The result and discussion in each month is described below.

Table 5. 8: The information of coal consumption and total cost from December 2013 to April 2014 (High heat of coal= Calorific value > 5,800 Kcal, Normal heat of coal = Calorific

| Period | Coal Specification | Avg. Price (THB/Month) | Total Actual Consumption (MT/Month) | Total Cost of Coal (THB/Month) | Ash Amount (MT/Month) | Ash Treat Fee (THB/Month) | Responsibility of Ash Treatment | Total Cost (THB/Month) |
|-----------|--|---------------------------|---|-----------------------------------|--------------------------|------------------------------|------------------------------------|---------------------------|
| Dec.2013 | Normal Heat : High Heat (100:0) | 2,549 | 9,979 | 25,436,471 | 520 | 260,000 | ABC | 25,696, <mark>4</mark> 71 |

value 5,500-5,800 Kcal)

As Table 5.8 shows, in January, the company chooses U Co., Ltd. to supply high heat of coal as an additional contract due to its competitive price, good coal quality and available of ash treatment license. Then, trial high heat (20%) mixing with normal heat (80%), the average unit price in January'14 (2,581 THB) is increasing from December'13 (2,549 THB) approximately 1.12% resulting from higher unit price of additional high heat contract. However, the volume consumption and ash amount is decreasing approximately 1.52% and 6.92% respectively. The total expenditure is also decreasing as well.

In February, the production still uses the same ratio as January dose in order to confirm the operation result. Hence, the unit price, coal consumption along with ash amount is quite the same.

In March which is the last trial month, the production performing research and production test. They surely confirm that the optimum point for mixing normal and high heat is 30:70. With this ratio, it can generate the maximum stream using in the production line. The unit price (2,720 THB) is increasing from February (2,581 THB) around 5.38%. However, the coal consumption and ash amount is significantly decreasing around 14% and 8.98% respectively.

After trail period with production confirmation, the purchasing department performs the quarter 2 /2014's contract. In this contract, the price ratio that concerned for the offer price and coal quality has also calculated. The lower value of price ratio indicated the proper offer price and good quality of coal when compared with other vendors. Purchasing team is not only optimizing high heat and low heat consumption ratio but also applying vendor optimization strategy referencing from the price ratio information in this contract as well. There are 4 out of 7 vendors selecting in this contract as shown in the Table 5.9. With huge portion (70%) of high heat supplying from U Co.,Ltd, negotiation for lower unit price and free ash treatment service can be negotiated and achieved.

| | | | | | | | | | | | Avg. Price | 2,540.00 |

Table 5. 9: Coal contract price, coal quality and price ratio for quarter 2/2014 (April-June 2014)

By comparing before and after implement the project (December'13 and April'14), the average unit price is slightly decreasing (0.3%) because of high mixing portion of high heat with higher unit price. However, the total cost is dramatically decreasing around 4,284,271 THB or 20%. This is resulting from a significant decreasing in consumption per month around 18% and no cost of ash elimination.

5.2.2 Sulfuric acid

Apply strategies

- Perform vendor optimization strategy in order to increase bargaining power, create competition among vendors and cost reduction as a target

Procedures

1. Inform the supplier for applying vendor optimization strategy in order to give them awareness for offering the best price

- 2. Biding for the offer price for quarter 2/2014 (April-July 2014)
- 3. Selecting supplier with the best offering price and performing volume allocation

Result and Discussion

Table 5. 10: Compare Sulfuric acid offer price

and volume allocation in quarter 1/2014 and quarter 2/2014

| Supplier Name | Factory Supply | Quarter 1/201 | 4 (JanMar.'14) | Quarter 2/201 | 4 (AprJul.'14) | % Price Different |
|-------------------|----------------|------------------------|------------------------|-----------------------|------------------------|---------------------------------|
| | | Unit Price | Quantity (MT) | Unit Price | Quantity | |
| H Co.,Ltd | PPD,PTT,AYT | 3,200 | 4,237 (41%) | 2,680 | 4,605 (43%) | -19% |
| H CO.,LIU | KPP | 3,700 | 4,237 (41/0) | 3,180 | 4,003 (4370) | -16% |
| V Co.,Ltd | PPD,PTT,AYT | 3,300 | 2,377 (23%) | 2,900 | 3,105 (29%) | -14% |
| v co.,Eta | KPP | 3,800 | 2,377 (2370) | 3,400 | 3,103 (29%) | -12% |
| X Co.,Ltd | PPD,PTT,AYT | 3,300 | 2,584 (25%) | 2,800 | 2,784 (26%) | -18% |
| A CO.,LIU | KPP | 3,800 | 2,364 (2376) | 3,300 | 2,784 (20%) | -15% |
| Y Co.,Ltd | PPD,PTT,AYT | 3,400 | 723 (7%) | 3,000 | | -13% |
| r co.,Ltu | KPP | 3,900 | 725 (770) | 3,500 | | -11% |
| Z Co., Ltd | KPP | 3,700 | 207 (2%) | 3,300 | 297 (2%) | -12% |
| Average Price and | d Total Volume | Avg. Price 3,413.36 | Total Volume 10,336 | Avg. Price 3,099.6 | Total Volume 10,710 | % Avg.Price Different -3.49% |
| Total Cost | | - | 35,280,488.96 | - | 33,196,716.00 | -6% |

As the Table 5.10 shows, the offered price for Quarter 2/2014 is dramatically decreasing. It is more than 10 % decreasing in offer price in every supplier. However, the supplier who offers the highest price is not selected to perform the contract. Y Co.,Ltd offers the highest unit price while H Co., Ltd offers the lowest one. Hence, Y Co.,Ltd is not

selected for supply sulfuric acid in this contract. However, Y Co., Ltd still has chance for bidding in the next quarter.

For selecting supplier, they receive more volume portion when comparing with previous quarter. The supplier with the lowest offer unit price will receive the highest volume portion and in descending order.

5.3 Bottleneck raw material

5.3.1 Urea

Apply strategies

- Perform vendor optimization strategy in order to increase bargaining power, create competition among vendors and cost reduction as a target
- Apply breakeven point formula between urea and ammonia (stated in session 5.1.1) in order to consider for the competitive raw material in term of price

<u>Procedure</u>

1). Calculate the breakeven point formula in order to compare the price competitive raw material between urea and ammonia.

As the session 5.1.1 stated above, urea price is more competitive. Hence, allocate more volume to urea is more competitive to the company. In this quarter, the volume portion between urea and ammonia is 90:10 as stated in the Table 5.11.

2). Search for the urea supplier in order to increase the bargaining power and lower the offer unit price

Result and Discussion

| | Quarter 1/20 | 14 (JanMar.) | | Urea Contra | act: Quarter | 2/2014 (AprJu | in.) |
|---------------|--------------|--------------|-------------|---------------|--------------|---------------|------------|
| Supplier name | Final Price | Contract | First offer | Second offer | Final price | Contract | Total Cost |
| | Final Price | Volume (MT) | (THB/MT) | (THB/MT) | (THB/MT) | Volume (MT) | Total Cost |
| G Co.,Ltd | 14,000 | 600 | 13,400 | 12,900 | - | - | - |
| H Co.,Ltd | - | - | 12,300 | 12,300 | 12,300 | 4,000 | 49,200,000 |
| B Co.,Ltd | - | - | 12,500 | 12,500 | 12,500 | 2,000 | 25,000,000 |
| I Co.,Ltd | - | - | 13,200 | - | - | - | - |
| J Co.,Ltd | - | - | 13,000 | 12,500 | 12,500 | 2,000 | 25,000,000 |
| Average price | 14,000 | 600 | Total Volu | me =8,000 MT/ | quarter (2,6 | 67 MT/month) | 99,200,000 |
| Average price | 14,000 | 600 | | Average Price | | 12 | ,400 |

Table 5. 11: Urea contract price and volume allocation for quarter1/2014 and quarter 2/2014

As the Table 5.11 shows, there is only one supplier supplies urea in quarter 1/ 2014 due to a few orders quantity when compare with ammonia. However, after apply new strategy such as breakeven point formula along with vendor optimization strategy in quarter 2/2014; urea is concerned as more competitive price. Hence, more volume portion is allocated to urea. There is 90:10 of urea and ammonia volume allocation respectively. With high order volume of urea, bidding among suppliers is performed in order to create competition atmosphere and lower the unit price. There are 3 out of 5 suppliers selected to supply urea in quarter 2 /2014. The one who offers the lowest offer price will receive the highest volume allocation. The average unit price is decreasing from 14,000 THB/MT to 12,400 THB/MT or 14.2% decreasing.

5.3.2 Potassium Chloride

Apply strategies

- Improve alternative supplier in order to increase the bargaining power, reduce the unit price and supply risk

<u>Procedure</u>

1). Search for the alternative vendor with the same product specification

2). Bidding for the offer price and performing the quarter 2/2014 (April-June 2014)'s contract

Result and Discussion

| Table 5. 12: Compare Potassium chloride offer unit pric | ce |
|---|----|
| between quarter $1/2014$ and quarter $2/2014$ | |

| Supplier Name | Quarte | er 1/2014 (January-Marc | h 2014) | Qua | rter 2/2014 (April-June | 2014) | |
|--------------------|------------|-------------------------|--------------|------------|-------------------------|--------------|--------------|
| Supplier Name | Unit price | Contract Volume (MT) | Total Cost | Unit Price | Contract Volume (MT) | Total Cost | % Total cost |
| AA Co.,Ltd | 25,000.00 | 180 (100%) | 4,500,000.00 | 23,000.00 | 110 (60%) | 2,530,000.00 | decresing |
| B Co.,Ltd | | | | 23,500.00 | 70 (40%) | 1,645,000.00 | |
| Average Unit Price | 25,000.00 | | 4,500,000.00 | 23,200.00 | | 4,175,000.00 | 7.20% |

As Table 5.12 shows, by approving alternative supplier, it can increase competition atmosphere. The alternative vendor, B Co.,Ltd attempts to offer lower unit price when compared with previous supplier. The offering unit price is 23,500 THB/MT. However, the previous supplier, AA Co.,Ltd requires high volume allocation. Hence, AA Co.,Ltd offers 23,000 THB/MT. Finally, AA Co.,Ltd gains 60% of volume allocation while B Co.,Ltd gains 40% of volume allocation. The percent of average unit price is decreasing approximately 7.20% when compared with previous quarter.

5.3.3 Antifoam GD-113 and 5.3.4 Succinic acid

Both Antifoam GD-113 and Succinic acid are having the same nature supply. Hence, they can apply the same strategy in order to improve the purchasing efficiency.

<u>Apply strategies</u>

- Shorten supply chain in order to reduce premium cost, shorter lead time and reduce risk
- Search alternative vendor with different source in order to increase bargaining power and lower the supply risk
- Apply yearly contract instead of monthly contract in order to lower the supply risk, reduce redundant work and reduce unit cost as well

<u>Procedure</u>

1). Inform the relevant parties about this project especially ATT (domestic trader) for not continuing the contract

2). Inform factory to forecast and send the yearly consumption plan to purchasing department

3). Search for the additional vender with different supply source but same product specification as well as current vendor

4). Apply yearly contract instead of monthly contract

Result and Discussion

Supply Chain Improvement

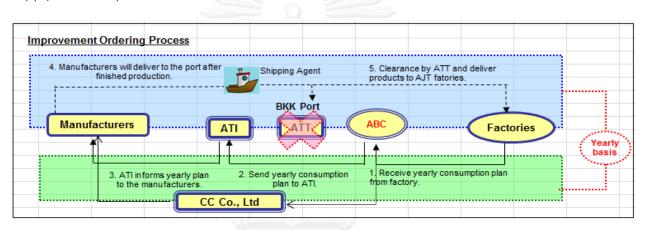

Figure 5.8: The improvement of ordering process by shorten the supply chain

As the Figure 5.8 shows, in order to shorten the supply chain, ATT is not chosen for continuing the contract. ABC purchasing team directly contracts with ATI which is concerned as overseas trader. The yearly consumption plan along with yearly purchasing order document is sent to the ATI and forwarded to manufacturer. Hence, manufacturer can advance perform the production planning. Moreover, purchaser also approves local alternative trader with different supply source which is CC Co.,Ltd. This can reduce lead time and supply risk in case there is shortage raw material situation from one supplier. Unit Cost Improvement

Table 5. 13: Compare the total average price of Antifoam GD-113 and

Succinic acid between March 2014's contract

and April-December 2014's contract

| | | Antifoa | m GD-113 and Succi | inic acid Cont | ract: Mar | . 2014 (Monthly C | ontract) |
|-----------------------------------|--------------------|----------------------------|--|-----------------|----------------------------|--|---------------------------|
| Name of Supplier | Antifoam GD-113 | Contract Volume (MT) | Antifoam GD-113 Total Cost (THB) | Succinic aci | Contra d Volum (MT) | e Total Cost | Total Cost/month (THB) |
| BB Co.,Inc. (Overseas Trader) | 175.00 | 6,000 (100%) | 1,050,000 | 109.50 | 1800 | 197,100.00 | 1,247,100.00 |
| | | | oam GD-113 and Succi | nic acid Contra | | | tract) |
| Name of Supplier | Antifoam GD-113 | Contract Volume (MT) | Antifoam GD-113 Total Cost | Succinic acid | Contract Volume (MT) | Succinic acid Total C | |
| BB Co.,Inc. (Overseas Trader) | 165.00 | 4,500 (25%)* | 742,500 | 98.00 | 1,350 (25%)* | 132,300. | 00 874,800.00 |
| CC Co., Ltd. (Domestic Trader) | 158.00 | 13,500 (75%)* | 2,133,000 | 95.50 | 4,050 (75%)* | 386,775. | 00 2,519,775.00 |
| Total Average Price | 161.5 | 18,000 | 2,865,500 THB/year (Total Cost per month = 958,500) | 96.75 | 5,400 | 519,075 THB/yea (Total Cost per mon = 173,025) | THB/vear (Total |
| | | *Antifoa | m GD-113 and Succini | a acid have 3 | orders per | year. | |

As shown in the Table 5.13, by approving the alternative vendor and perform yearly contract instead of monthly, purchaser has more bargaining power to negotiate the unit price and reduce the redundant works. The average unit price of antifoam GD-113 is decreasing 7.71% while there is 11.60% decreasing in succinic acid average unit price.

5.3.5 Ammonium chloride

Apply strategy

- Improve alternative supplier in order to increase the bargaining power, reduce the unit price and supply risk

<u>Procedure</u>

1). Search for the alternative vendor with the same product specification

2). Bidding for the offer price and performing the quarter 2/2014 (April-June 2014)'s contract

Result and Discussion

| Table 5. 14: Compare Ammonium chloride offer unit price | |
|---|--|
| between quarter $1/2014$ and quarter $2/2014$ | |

| Supplier Name | Quarte | r 1/2014 (January-Marc | h 2014) | Qua | rter 2/2014 (April-June 2 | 2014) | 0/ T -t-lt |
|--------------------|------------|------------------------|------------|------------|---------------------------|------------|-------------------|
| | Unit price | Contract Volume (MT) | Total Cost | Unit Price | Contract Volume (MT) | Total Cost | % Total cost |
| AA Co., Ltd | 11,000.00 | 30 (100%) | | | 142,500.00 | decreasing | |
| H Co., Ltd | | | | 9,500.00 | 15 (50%) | 142,500.00 | |
| Average Unit Price | 11,000.00 | | 330,000.00 | 9,500.00 | | 285,000.00 | -13.63% |

As shown in the Table 5.14, by approving alternative supplier which is H Co.,Ltd, it is increasing in competition atmosphere. Both two supplier offer for the same unit price hence, the percent volume allocation is the equivalent which is 50%. The average unit cost is decreasing from the previous contract approximately 13.63%.

5.4 Conclusion

The conclusion results are summarized and shown in the Tables 5.15 and 5.16. Those summarized tables conclude the applied strategies along with improvement points. The priority concern for strategic raw material is to reduce the supply risk and average unit cost. The priority concern for the leverage raw material is to lowering the unit price and total cost. For the bottleneck raw material, the priority concern is to reduce the supply risk. With different group in supply positioning model, the different strategies are chosen to apply. The details are shown in the tables below.

Table 5. 16: The summary results and improvement points

of bottleneck raw material

CHAPTER VI

CONCLUSION AND SUGGESTIONS

This chapter concludes for the improvement plan and strategies applied to each raw material position (critical, bottleneck, and leverage). The result improvement in terms of the cost reduction and supply risk are also indicated. Finally, both short to medium term plan and long term plan are also suggested in the end of the session. The covered topics are following.

6.1 Improvement plan and strategy conclusion

6.2 Result conclusion

6.2.1 Cost reduction

6.2.2 Reduce supply risk

6.3 Future plans and suggestions

6.3.1 Short to medium term plan

6.3.2 Long term plan

6.4 Conclusion

6.1 Improvement plan and strategy conclusion

By using the supply positioning model to classify the group of raw material; it can be classified raw materials into 4 groups which are strategic, bottleneck, leverage and routine. The strategic raw materials are ammonia, caustic soda, and hydrochloric acid. The main strategy is to reduce supply risk along with unit price due to high expenditure per annual (Class A raw material). To reduce supply risk, the alternative products have been approved and the breakeven point formulas have defined in order to find the equivalent price and compare for the offer price when performing the contract. This is not only reducing supply risk but also reducing unit price and total cost in case the alternative raw material has more competitive market price. For the leverage raw materials, there are coal and sulfuric acid. The major target to achieve is cost reduction. To achieve this target, create more on competition atmosphere among suppliers to increase purchasing power is applied. For bottleneck raw materials, there are urea, potassium chloride, antifoam GD-113, succinic acid and ammonium chloride. The major target is to reduce supply risk. By searching for alternative suppliers along with alternative sources is a major applied strategy. However, there are no selected raw materials that are located in the routine position.

6.2 Result conclusion

After performing the purchasing improvement project, the achieved improvement points can be classified into two issues which are cost reduction and reduce supply risk. These improvement points are achieved the thesis objectives and covered the expected benefits that stated in the chapter I. The improvement results are following.

6.2.1 Cost reduction

As the Table 6.1 shows, before applying the purchasing improvement project, the total expenditure of selected raw materials (10 selected raw materials) is 238,667,100 THB/month. After apply the improvement strategy, the total cost is reducing to 220,966,525.00 THB/month. Hence, the cost reduction per month is 17,700,575.00 THB/month or 7.42% reduction.

Table 6. 1: The summary table of cost reduction after implementingthe purchasing improvement project

| Before | Apply Improvement Strategy | Aft | er Apply Improvement Strategy | Cost Reduction per month | % Reduction per month |
|------------|----------------------------------|------------|--|--------------------------|-----------------------|
| Total Cost | 238,667,100.00 THB/month | Total Cost | 220,966,525 .00 THB/month | 17,700,575.00 THB | 7.42% |
| | - 3 Items in Critrical Position | | No items located in Critrical Position (Move to leverage position) | | |
| Risk | - 5 Items in Bottleneck Position | Risk | - No items located in Bottleneck Position (Move to Routine and leverage position) | | |

6.2.2 Reduce supply risk

As the Table 6.1 and Figure 6.1 show, before applying the purchasing improvement project, there are 3 raw materials located in critical position which are concerned as high expenditure along with high risk and 5 raw materials located in bottleneck position which are concerned as low expenditure but high risk. After implementing the improvement strategy, there are no items located in critical and bottleneck position. The strategic raw materials are moved to leverage position and bottleneck raw materials are moved to routine position and leverage position.

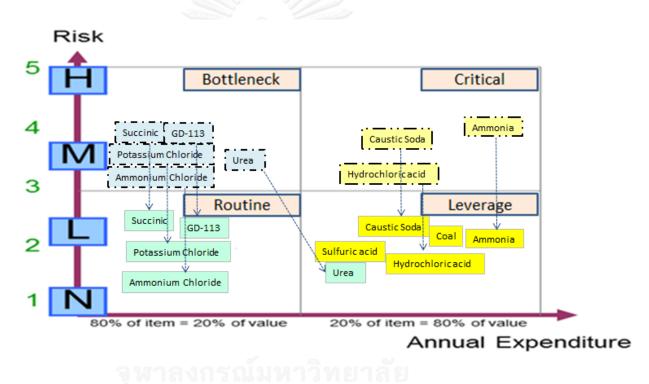

Figure 6. 1: The supply positioning movement of improved raw material

6.3 Future plans and suggestions

The future plans can be separate into two types which are short to medium term and long term as following.

6.3.1 Short to medium term plan

As stated above, hydrochloric acid which is concerned as a strategic raw material also has an alternative product (sulfuric acid). However, hydrochloric acid has a pending contract from January to June 2014. Therefore, sulfuric acid cannot apply for using in the production line even there is more competitive price in this period (quarter 2/2014).

For the short term plan, after hydrochloric acid contract is terminated, the breakeven point formula is applied for calculating the equivalent price of these two products. The more competitive raw material is chosen to perform the contract.

6.3.2 Long term plan

In the future, control and monitor the applied strategy along with market situation are required. However, the applied strategies are needed to adapt and match to the particular situation.

6.4 Conclusion

Purchasing department is concerned as a strategic department dealing with the cost of company. In order to have a good financial performance along with low supply risk, the improvement of purchasing strategies are applied. Firstly, applying the Pareto Analysis in order to classify the list of raw materials based on annual expenditure in to three classes, class A chemical raw materials and top five with high supply risk from class B chemical raw materials are focused and selected for applying procurement improvement in terms of cost reduction and reduce supply risk. Due to the limitation of study scope, only chemical raw materials are concerned. The selected raw materials are ammonia, caustic soda, hydrochloric acid, coal, sulfuric acid, urea, antifoam GD-113, succinic acid and ammonium chloride. Secondly, applying Five Force Analysis tool to each selected chemical raw material, the average risk scores from brain storming session are indicated. The raw materials with average risk score equal or more than 3 are concerned as high supply risk. While, the raw materials with average risk score less than 3 are concerned as low supply risk. Thirdly, the average risk score information from Five Force Analysis and annual expenditure information from Pareto Analysis can plot each raw material positions in Supply Positioning Model. Those raw materials can be classified into four classes which are critical, bottleneck, leverage and routine. Critical raw materials are ammonia, caustic soda and hydrochloric acid. Bottleneck raw materials are antifoam GD-113, succinic acid and ammonium chloride. Leverage raw materials are coal and sulfuric acid. However, there are no raw materials classified as routine. Fourthly, Purchasing Portfolio Matrix is applied. The supplier power against the buyer power is compared. Hence, the purchasing power of each raw material can be indicated. Finally, the proper strategies are applied to each raw material based on their supply position. The main strategies for critical raw materials are reducing supply risk and average unit price. The main strategies for bottleneck raw materials are reducing supply risk while the main strategies for leverage raw materials are reducing average unit price. Although the cost of reduction and reduce supply risk are considered as significant points, maintaining the supplier relationship is also an important issue to concern when performing the contract as well. After applying this improvement procurement project, the total expenditure is reducing from 238,667,100 THB/month to 220,966,525.00 THB/month. Hence, the cost reduction per month is 17,700,575.00 THB/month or 7.42% reduction. For the supply risk, before applying the purchasing improvement project, there are 3 raw materials located in critical position which are concerned as high expenditure along with high risk and 5 raw materials located in bottleneck position which are concerned as low expenditure but high risk. After implementing the improvement strategy, there are no items located in critical and bottleneck position. The strategic raw materials are moved to leverage position and bottleneck raw materials are moved to routine position and leverage position. Hence, it can be concluded that the project objectives are achieved.
