**สารวุธ ธรรมบุญญา** : ลักษณะปราการภูของหินและการก่อตัวใหม่ของหมวดหินเข้าขาดในพื้นที่จังหวัดสระบุรีตอนกลางของประเทศไทย. (LITHOFACIES AND DIAGENESIS OF THE KHAO KHAD FORMATION IN THE VICINITY OF CHANGWAT SARABURI, CENTRAL THAILAND) อ. ที่ปรึกษา: รศ. ดร. วิสุทธิ พิสุทธอานันท์, อ. ที่ปรึกษาร่วม: รศ. ดร. ชัยยุทธ ขันทประน 271 หน้า. ISBN 974-14-2069-2.

หมวดหินเข้าขาดของกลุ่มหินสระบุรีในที่จังหวัดสระบุรีประกอบด้วยลำดับชั้นของหินปูน หินปูนเนื้อโคลอมิติก และหินดินดานปูนหินทรายเป็น มีชั้นและกระเบาะของหินเชิร์ตแทรกปูน หมวดหินเข้าขาดสะสมตัวสมัยแอลอสติกเลียน ต้นบุคเพอร์เมียน ถึง สมัยคาพิดานีเยน กลายบุคเพอร์เมียน ในการศึกษาครั้งนี้ได้ทำการตรวจวัดชั้นหิน และศึกษาลักษณะเฉพาะของลำดับชั้นตะกอน ทั้งหมด 29 แนว รวมระยะทาง 28,603 เมตร พร้อมทั้งเก็บตัวอย่างหิน จำนวน 536 ตัวอย่าง โดยเลือกเก็บตัวอย่างหินเมื่อพบร่องรอยเปลี่ยนแปลงของชนิดหินตามลำดับชั้นหิน จากนั้นนำหินไปตรวจสอบในห้องปฏิบัติการเพื่อจำแนกลักษณะเฉพาะของเนื้อหิน ส่วนประกอบ และกำหนดชื่อหิน หมวดหินเข้าขาด ประกอบด้วย ดิตามิโคต์ ใบโอมิโคต์ ใบโอมิรูโคต์ แพ็คใบโอมิโคต์ ใบโอมิเพลสแบปไรต์ ใบโอมิเพลสแบปไรต์ อินทราราสแบปไรต์ อินทราราสแบปไรต์ ใบโอมิโคต์ และแคลลิไทต์ การจำแนกลักษณะปราการภูทางกายภาพของลำดับชั้นตะกอนกระทำโดยใช้ลักษณะเฉพาะทางกายภาพ สามารถจำแนกลำดับชั้นตะกอนออกได้เป็น 15 แนว ที่บ่งบอกถึงสภาพแวดล้อมในการสะสมตัวของตะกอนบริเวณทะเลดีนหลังสันดอน บริเวณสันดอน และบริเวณที่ลาดเอียงด้านหน้าสันดอน

หินในหมวดหินเข้าขาดถูกเปลี่ยนแปลงด้วยกระบวนการก่อตัวใหม่ที่ซับซ้อน พบว่ากระบวนการก่อตัวใหม่ในช่วงดันประกอบด้วย กระบวนการมิคริไต์เซร์ชัน การเชื่อมเนื้อตะกอนด้วยแร่แคลไซด์หลายชนิด ได้แก่นิค ผลึกละเอียด กลุ่มแท่งเข็ม แท่งผลึก และผลึกพอกขยายจากเม็ดตะกอน นอกจากนั้นยังพบการละลาย การกดทับขณะตะกอนยังไม่แข็งตัว การแทนที่ด้วยแร่โดโลไมต์ชนิดผลึกละเอียด และละลาย ปานกลาง และการแทนที่ด้วยสารซิลิ喀

กระบวนการก่อตัวใหม่ในช่วงปัจจุบันประกอบด้วย การแทนที่ด้วยแร่โดโลไมต์ชนิดผลึกหยาบ การแทนที่แร่โดโลไมต์ด้วยแร่แคลไซด์ และแร่แคลไซด์ที่มีธาตุเหล็กปูน การละลายเนื้อองจากการอัดแน่น และการแตกผลึกใหม่ การวิเคราะห์ส่วนประกอบในเนื้อหินพบว่าออกซิเจนไอโซโทปมีค่าตั้งแต่ -5.96 ถึง 5.49 % และคาร์บอนไอโซโทปมีค่าตั้งแต่ -16.75 ถึง -2.31 % ซึ่งน้อยกว่าค่ามาตรฐานของการบ่อนเนตในน้ำทะเลในบุคเพอร์เมียน ซึ่งน่าจะมีสาเหตุมาจากการเปลี่ยนแปลงในการก่อตัวใหม่ พบว่าหมวดหินเข้าขาดนี้ปริมาณธาตุร่องรอยที่น้อย เช่นเดียวกับที่พบในกลุ่มหินราชบุรี และหมวดหินน้ำมหกรรม จังหวัดเลย

KEY WORD: Sedimentology / Lithofacies / Diagenesis / Permian carbonate rocks / Thailand

SARAWUTH THAMBUNYA: LITHOFACIES AND DIAGENESIS OF THE KHAO KHAD FORMATION IN THE VICINITY OF CHANGWAT SARABURI, CENTRAL THAILAND. THESIS ADVISOR: ASSOC. PROF. VISUT PISUTHA-ARNOND, Ph.D. THESIS COADVISOR: ASSOC. PROF. CHAIYUDH KHANTAPRAB, Ph.D.

271 pp. ISBN 974-14-2069-2.

The Khao Khad Formation of Saraburi Group in the vicinity of Changwat Saraburi area is a repetitive sequence of limestone, dolomitic limestone and silt-shale with nodular and banded cherts. The age of the Khao Khad Formation lies between Asselian of Lower Permian to Capitanian of Middle Permian. Twenty nine measured sections, totally 28,603 meters long, were conducted to determine the lithological characteristics of sedimentary sequences. Altogether 536 rock samples of stratified sampling type were obtained from all the measured sections for petrographic determination of textures, composition and rock classification. The Khao Khad Formation consists of dismicrite, biomicrite, biomicrudite, packed biomicrite, biopelsparite, biosparite, intrasparite, intrasparudite, biolithite and calcilithite. Fifteen lithofacies were distinguished from the sequence indicating the depositional environments varying from shallow restricted marine to barrier bar and foreslope.

The rocks of Khao Khad Formation have suffered a complex diagenetic alteration. The processes occurred during early diagenesis were micritization, microcrystalline calcite cement, meniscus cement, acicular fibrous cementation, burrowing, microcrystalline dolomitization, radial fibrous calcite cement, dog-tooth calcite cement, early compaction, equant calcite cement, blocky calcite cement, syntaxial overgrowth cementation, dissolution, microcrystalline dolomitization, mesocrystalline dolomitization, and silicification. The processes occurred during late diagenesis were macrocrystalline dolomitization, calcitization or dedolomitization, ferroan calcitization, dissolution compaction, and neomorphism.

The individual carbonate fabrics and the whole-rock samples have the isotopic composition varying from -5.96 to 5.49 ‰PDB for the  $\delta^{13}\text{C}$  values and from -16.75 to -2.31 ‰PDB for the  $\delta^{18}\text{O}$  values. Even though such the isotopic signature still reflect marine source, both  $\delta^{18}\text{O}$  and  $\delta^{13}\text{C}$  values are somewhat lighter than the normal Permian seawater carbonates probably due to the isotopic exchange with lighter isotopic sources during diagenesis. The low contents of most trace elements in the rocks of Khao Khad Formation are similar to those found in the Ratburi limestone and Nam Maholan limestone from Loei.

## ACKNOWLEDGEMENTS

The author would like to express his deep appreciation his thesis advisor, Associate Professor Dr. Visut Pisutha-Arnond and co-advisor, Associate Professor Dr. Chaiyudh Khantaprab, for their invaluable advices, suggestion and critical reading of the manuscript. Grateful acknowledgements are extended TPI Polene Public Company Limited, especially Mr. Mana Trakulngam, Assistant Vice President, Mr. Kamol Thavomsate, CEO Consultant, and Mr. Sompob Teppanich, Assistant Quarry Department Manager, for the generous permission granted to him to undertake this study.

The author is highly indebted to his colleagues in Quarry Department, TPI Polene Public Company Limited, for their assistance and supports during the leave of works. Special recognition and thanks are also due to Mr. Phisit Dheeradilok, CEO consultant, and Mr. Lertsin Raksaskulwong, senior geologist, Geological Survey Division, Department of Mineral Resources, for their suggestion and encouragement.

Assistant Professor Dr. Chakkaphan Sutthirat is gratefully acknowledged for supervise during the EPMA works. Dr. Christoph Hauzenberger, Institute of Earth Sciences, University Graz, Austria, also gratefully acknowledged for the help analyzing the stable oxygen and carbon isotopes. Thanks are also extended to his friends in the Department of Geology, Chulalongkorn University for their help and encouragement.

This thesis could not have been accomplished without the help and encouragement of the author's parents.
