APPENDICES

Appendix A Optimum condition for the recovery of light components by using surfactant and electrolyte solution.

The optimum condition, i.e. sludge-to-surfactant ratio, stirring speed, stirring time and leaving time, was investigated prior to the further experiment. The studied parameter was varied while the other parameters would be kept constant. The results are shown in Figure A1-A4. The highest recovery was achieved at the sludge-to-surfactant ratio of 1: 8 after the mixture was stirred at 200 rpm for 30min. Moreover, the system required at least 12 for the complete oil phase separation. These conditions were used for the further experiments.

Figure A1 Recovery of light components at various sludge-to-surfactant ratios.

Figure A2 Recovery of light components at various stirring times.

Figure A3 Recovery of light components at various stirring speeds.

Figure A4 Recovery of light Components at various leaving times.

Appendix B Viscosity-average molecular weight of polyelectrolyte.

Table B1 The data of relative viscosity (η_{rel}), specific viscosity (η_{sp}), reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) of Permafloc 2628

| Concentration (g/100ml) | t (sec) | t ₀ (sec) | η_{rel} | η_{sp} | η_{red} | η_{inh} |
|-------------------------|---------|----------------------|--------------|-------------|--------------|--------------|
| 0.001 | 250.40 | 216.90 | 1.1545 | 0.1545 | 154.46 | 143.64 |
| 0.002 | 293.78 | 216.90 | 1.3544 | 0.3544 | 177.22 | 151.69 |
| 0.003 | 326.20 | 216.90 | 1.5039 | 0.5039 | 167.97 | 136.02 |
| 0.004 | 376.33 | 216.90 | 1.7351 | 0.7351 | 183.76 | 137.76 |

Figure B1 Plot of reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) versus concentration of Permafloc 2628.

The intrinsic viscosity, $[\eta]$, could be determined from y-intercept. The viscosity-average molecular weight of Permafloc 2628 was calculated base on Mark-Houwink equation.

$$[\eta] = KM^a$$

where $[\eta]$ is intrinsic viscosity, M is viscosity-average molecular weight, K and a are constants. For polyacrylamind:

$$K = 6.5 \times 10^{-3} \text{ ml/g}$$

$$a = 0.82$$

$$\text{y-intercept} = 150.9$$

$$\text{From calculation; } M = 5.80 \times 10^7$$

The viscosity-average molecular weight of Permafloc 2628 obtained from the calculation was 5.80×10^7

Table B2 The data of relative viscosity (η_{rel}), specific viscosity (η_{sp}), reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) of Permafloc 2525

| Concentration (g/100ml) | t (sec) | t ₀ (sec) | η_{rel} | η_{sp} | η_{red} | η_{inh} |
|----------------------------|---------|----------------------|--------------|-------------|--------------|--------------|
| 0.001 | 249.44 | 216.90 | 1.1500 | 0.1500 | 150.01 | 139.77 |
| 0.002 | 282.81 | 216.90 | 1.3039 | 0.3039 | 151.91 | 132.68 |
| 0.003 | 319.82 | 216.90 | 1.4745 | 0.4745 | 158.17 | 129.44 |
| 0.004 | 353.89 | 216.90 | 1.6316 | 0.6316 | 157.89 | 122.39 |

Figure B2 Plot of reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) versus concentration of Permafloc 2525.

The intrinsic viscosity, $[\eta]$, could be determined from y-intercept. The viscosity-average molecular weight of Permafloc 2525 was calculated base on Mark-Houwink equation.

$$[\eta] = KM^a$$

where $[\eta]$ is intrinsic viscosity, M is viscosity-average molecular weight, K and a are constants. For polyacrylamind:

$$K = 6.5 \times 10^{-3} \text{ ml/g}$$

$$a = 0.82$$

$$\text{y-intercept} = 146.0$$

$$\text{From calculation; } M = 5.57 \times 10^7$$

The viscosity-average molecular weight of Permafloc 2525 obtained from the calculation was 5.57×10^7

Table B3 The data of relative viscosity (η_{rel}), specific viscosity (η_{sp}), reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) of Wachem Floctex 2602

| Concentration (g/100ml) | t (sec) | t ₀ (sec) | η_{rel} | η_{sp} | η_{red} | η_{inh} |
|-------------------------|---------|----------------------|--------------|-------------|--------------|--------------|
| 0.001 | 249.88 | 216.90 | 1.1520 | 0.1520 | 152.04 | 141.53 |

Figure B4 Plot of reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) versus concentration of Wachem Floctex 2431.

The intrinsic viscosity, $[\eta]$, could be determined from y-intercept. The viscosity-average molecular weight of Wachem Floctex 2431 was calculated base on Mark-Houwink equation.

$$[\eta] = KM^a$$

where $[\eta]$ is intrinsic viscosity, M is viscosity-average molecular weight, K and a are constants. For polyacrylamind:

$$K = 6.5 \times 10^{-3} \text{ ml/g}$$

$$a = 0.82$$

$$\text{y-intercept} = 133.4$$

$$\text{From calculation; } M = 4.99 \times 10^7$$

The viscosity-average molecular weight of Wachem Floctex 2431 obtained from the calculation was 4.99×10^7

Table B5 The data of relative viscosity (η_{rel}), specific viscosity (η_{sp}), reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) of Wachem Floctex 2413

| Concentration (g/100ml) | t (sec) | t ₀ (sec) | η_{rel} | η_{sp} | η_{red} | η_{inh} |
|-------------------------|---------|----------------------|--------------|-------------|--------------|--------------|
| 0.001 | 244.78 | 216.90 | 1.1286 | 0.1286 | 128.55 | 120.94 |
| 0.002 | 280.51 | 216.90 | 1.2933 | 0.2933 | 146.63 | 128.59 |
| 0.003 | 312.14 | 216.90 | 1.4391 | 0.4391 | 146.36 | 121.33 |
| 0.004 | 340.09 | 216.90 | 1.5680 | 0.5680 | 141.99 | 112.45 |

Figure B5 Plot of reduced viscosity (η_{red}) and inherent viscosity (η_{inh}) versus concentration of Wachem Floctex 2413.

The intrinsic viscosity, $[\eta]$, could be determined from y-intercept. The viscosity-average molecular weight of Wachem Floctex 2413 was calculated base on Mark-Houwink equation.

$$[\eta] = KM^a$$

where $[\eta]$ is intrinsic viscosity, M is viscosity-average molecular weight, K and a are constants. For polyacrylamind:

$$K = 6.5 \times 10^{-3} \text{ ml/g}$$

$$a = 0.82$$

$$\text{y-intercept} = 129.9$$

$$\text{From calculation; } M = 4.83 \times 10^7$$

The viscosity-average molecular weight of Wachem Floctex 2413 obtained from the calculation was 4.83×10^7

Appendix C Mathematic modeling

The thermal decomposition of the sludge can be expressed by

$$\ln\left(\frac{F(x)}{T^2}\right) = \ln \frac{A_i R}{\beta E_{ai}} \left(1 - \frac{2RT}{E_{ai}}\right) - \frac{E_{ai}}{RT},$$

where

$$F(x) = \begin{cases} -\ln(1-x) & n = 1 \\ \frac{1 - (1-x)^{1-n}}{1-n} & n \neq 1 \end{cases}.$$

The independent pseudo bi-component model is applied for the weight loss of the sludge.

$$\frac{dx}{dT} = \begin{cases} \frac{dx_1}{dT} & W_{10} < W < W_{1\infty} \\ \frac{dx_2}{dT} & W_{1\infty} = W_{20} < W < W_{2\infty} \end{cases}.$$

The DTG data were divided into two temperature intervals. A plot of $\ln\left(\frac{F(x)}{T^2}\right)$ against $\frac{1}{T}$ should result in a straight line of the slope $-\frac{E_{ai}}{R}$ and the y-intercept $\ln \frac{A_i R}{\beta E_{ai}} \left(1 - \frac{2RT}{E_{ai}}\right)$ for the correct reaction order as shown in Figure C1-C12. Activation energy (E_{ai}) and pre-exponential factor (A_i) of each section can be calculated from the slope and y-intercept, respectively.

Figure C1 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.6$, of first reaction zone of original sludge pyrolysis (120-365°C) for 5°C/min heating rate.

Figure C2 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 3.0$, of second reaction zone of original sludge pyrolysis (365-680°C) for 5°C/min heating rate.

Figure C3 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.4$, of first reaction zone of original sludge pyrolysis (120-380°C) for 10°C/min heating rate.

Figure C4 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 3.6$, of second reaction zone of original sludge pyrolysis (380-680°C) for 10°C/min heating rate.

Figure C5 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.3$, of first reaction zone of original sludge pyrolysis (120-400°C) for 20°C/min heating rate.

Figure C6 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 3.8$, of second reaction zone of original sludge pyrolysis (400-680°C) for 20°C/min heating rate.

Figure C7 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.4$, of first reaction zone of treated sludge pyrolysis (120-340°C) for 5°C/min heating rate.

Figure C8 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.8$, of second reaction zone of treated sludge pyrolysis (340-680°C) for 5°C/min heating rate.

Figure C9 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.4$, of first reaction zone of treated sludge pyrolysis (120-340°C) for 10°C/min heating rate.

Figure C10 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.7$, of second reaction zone of treated sludge pyrolysis (340-680°C) for 10°C/min heating rate.

Figure C11 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.3$, of first reaction zone of treated sludge pyrolysis (120-340°C) for 20°C/min heating rate.

Figure C12 Relationship between $\ln\left(\frac{F(x)}{T^2}\right)$ and $\frac{1}{T}$ with equation and R^2 , $n = 1.5$, of second reaction zone of treated sludge pyrolysis (340-680°C) for 20°C/min heating rate.

The pre-exponential factor (A_i) of each section can be calculated from

$$y - \text{int except} = \frac{A_{iR}}{\beta E_{ai}} \left(1 - \frac{2RT}{E_{ai}} \right)$$

Then, the values of A_i at various temperature are plotted to express the relationship between A_i and T . The relationship between A_i and T are shown in Table C1.

Table C1 The relationship between pre-exponential factor (A) and temperature (T)

| Type of sludge | Heating rate (°C/min) | Reaction step | Relation function | Temperature range (K) |
|-----------------|-----------------------|---------------|---|-----------------------|
| Original sludge | 5 | 1 | $A(T) = 0.3219T^2 + 575.29T + 2 \times 10^6$ | 120-365 |
| | | 2 | $A(T) = 4019.8T^2 + 2 \times 10^7T + 2 \times 10^{11}$ | 365-680 |
| | 10 | 1 | $A(T) = 0.0649T^2 + 93.308T + 334664$ | 120-380 |
| | | 2 | $A(T) = 2 \times 10^8T^2 + 2 \times 10^{12}T + 2 \times 10^{16}$ | 380-680 |
| | 20 | 1 | $A(T) = 0.0394T^2 + 55.848T + 202610$ | 120-400 |
| | | 2 | $A(T) = 4 \times 10^{10}T^2 + 4 \times 10^{14}T + 6 \times 10^{16}$ | 400-680 |
| Treated sludge | 5 | 1 | $A(T) = 0.0329T^2 + 38.212T + 127428$ | 120-340 |
| | | 2 | $A(T) = 0.0214T^2 + 34.924T + 177664$ | 340-680 |
| | 10 | 1 | $A(T) = 0.048T^2 + 62.097T + 211095$ | 120-340 |
| | | 2 | $A(T) = 0.0132T^2 + 19.395T + 97900$ | 340-680 |
| | 20 | 1 | $A(T) = 0.0302T^2 + 67.171T + 230037$ | 120-340 |
| | | 2 | $A(T) = 0.0074T^2 + 9.6915T + 48841$ | 340-680 |

Refined A_i can be obtained from

$$A_i = \frac{\int_{T_0}^T A_i(T) dT}{dT}$$

The values of pre-exponential are shown in Table C2.

Table C2 Pre-exponential factor of each temperature range

| Type of sludge | Heating rate (°C/min) | Reaction step | A (min ⁻¹) | Temperature range (K) |
|-----------------|-----------------------|---------------|------------------------|-----------------------|
| Original sludge | 5 | 1 | 2.39×10 ⁶ | 120-365 |
| | | 2 | 2.18×10 ¹¹ | 365-680 |
| | 10 | 1 | 4.02×10 ⁵ | 120-380 |
| | | 2 | 2.17×10 ¹⁶ | 380-680 |
| | 20 | 1 | 2.44×10 ⁵ | 120-400 |
| | | 2 | 6.35×10 ¹⁸ | 400-680 |
| Treated sludge | 5 | 1 | 1.55×10 ⁵ | 120-340 |
| | | 2 | 2.18×10 ⁵ | 340-680 |
| | 10 | 1 | 2.55×10 ⁵ | 120-340 |
| | | 2 | 1.21×10 ⁵ | 340-680 |
| | 20 | 1 | 2.77×10 ⁵ | 120-340 |
| | | 2 | 6.10×10 ⁴ | 340-680 |

In order to obtain the refined E_{ai} , the values activation energy for each temperature were calculated.

$$f(E_{ai}) = \ln\left(\frac{F(x)}{T^2}\right) - \ln\frac{A_i R}{\beta E_{ai}} \left(1 - \frac{2RT}{E_{ai}}\right) + \frac{E_{ai}}{RT} = 0$$

Numerical method is used to solve this equation. The values activation energy are shown in Table C3.

Table C3 Activation energy of each temperature range

| Type of sludge | Heating rate (°C/min) | Reaction step | E_a (kJ/mol) | Temperature range (K) |
|-----------------|-----------------------|---------------|----------------|-----------------------|
| Original sludge | 5 | 1 | 55.58 | 120-365 |
| | | 2 | 138.25 | 365-680 |
| | 10 | 1 | 50.15 | 120-380 |
| | | 2 | 203.39 | 380-680 |
| | 20 | 1 | 50.36 | 120-400 |
| | | 2 | 239.67 | 400-680 |
| Treated sludge | 5 | 1 | 44.55 | 120-340 |
| | | 2 | 66.09 | 340-680 |
| | 10 | 1 | 46.74 | 120-340 |
| | | 2 | 63.34 | 340-680 |
| | 20 | 1 | 47.49 | 120-340 |
| | | 2 | 60.72 | 340-680 |

CURRICULUM VITAE

Name: Ms. Kraumas Supaphol

Date of Birth: October 21, 1979

Nationality: Thai

University Education:

1998-2002 Bachelor degree of Science in Chemical Technology (2nd class honor), Faculty of Science, Chulalongkorn University

Proceeding:

Supaphol, K., Rangsunvigit, P., Meeyoo, V., Rirksomboon, T., Kitiyanan, B., and Kalambaheti, C. (2003). Recovery of Light Components from API Separator Sludge. Annual Conference of Thai Institute of Chemical Engineering and Applied Chemistry (TIChE), 30-31st October, Nakornnayok, Thailand.
