CHAPTER IV

ASSIGNING RESORUCE COSTS TO FINAL COST OBJECTS

Once activities within business process have been identified in previous chapter, the next step in developing the ABC system is to trace the flow of costs from resources to final cost objects, the vertical cost assignment view. This step is separated into two steps. The first step is assigning resource costs to activities. Then, assigning activity costs to final cost object is the second step. However, cost elements captured from general ledger and profit & loss account, are too detailed. The cost assignment is unable to perform with these cost elements. It is necessary to organize these cost elements into appropriate groups in order to support cost assignment.

4.1 Identify Organizational Cost Structure

Identifying organizational cost structure requires setting the scope of cost data. As mentioned, the scope of this study is entire organization. The scope of cost data, therefore, will include all expenses and depreciation but not all kinds of tax expense. Time interval for collecting cost data is between Jun to Nov 2005.

Various cost elements from P&L account and general ledger can be organized into 15 cost groups. Those are direct materials, indirect materials, tools \$ equipments, maintenance, electricity, water, salary, direct labour, fringe benefits, travelling, fuel, office accessories, miscellaneous, communication, and depreciation cost as shown in figure 4.1. These 15 costs will be reorganized into appropriate form in order to support performing cost assignment.

Figure 4.1 Organizational Cost Structure

4.1.1 Direct Material

In casting work, direct material can be separated into three major categories. The first is metal and chemical composition. This category is major components for making two different type of casting materials, FC and FCD. The second is silica sand and sand composition. These materials are major components for making sand mould. Finally, the last material is resin sand, which is a major component for making core. The table 4.1 represents total direct material cost from June to November 2005.

Direct Materials	Baht
Metal and Chemical compositions for FC	17,759,620
Metal and Chemical compositions for FCD	3,266,477
Sand and Sand Compositions for AMF	2,706,214
Sand and Sand Compositions for FD1	47,432
Sand and Sand Compositions for FD2	20,328
Resin Sand	260,330
Total	24 060 400

Total24,060,400Table 4.1 Direct Material Costs from Jun – Nov 2005

4.1.2 Indirect Materials

Indirect materials are materials that are not directly combined in products but they are needed in manufacturing process. For example, strainer (512-13) is used to reduce speed of melted metal poured to sand mould. Table 4.2 shows the group of indirect material cost from Jun to Nov 2005.

Code	Materials	Total	Code	Materials	Total
501-07	Slag Top-C	169,680	512-26	Argon Gas	74,800
512-01	Concrete D-10	14,700	512-27	LPG Gas	323,538
512-02	Concrete 15	127,995	512-28	Rust Oil	34,397
512-03	Cement	1,380	512-29	Automatic Transmission Fluid	2,692
512-04	Miga	11,880	512-30	Lubricant	9,268

			512-54	Slag Top-C		169,680
					Total	2,900,988

Table 4.2 Indirect Material Costs from Jun - Nov 2005

4.1.3 Tools & Equipments and Maintenance

Mostly, machines need to change spare parts when time is come or when they are no longer to use. In addition, some machines require maintenance from outside companies. Table below shows tools & equipments and maintenance expenses from Jun - Nov 2005.

Items	Jun	Jul	Aug	Sep	Oct	Nov	Total
Tools & Equipments	328,647	370,091	501,602	443,058	297,278	261,251	2,201,928
Maintenance	38,710	45,535	97,770	75,415	10,085	248,520	516,035
Total	367,357	415,626	599,372	518,473	307,363	509,771	2,717,963

4.1.4 Electricity

Electricity	Jun	Ja	Aug	Sep	Oct	Nov	Total				
Units	520,000	535,640	513,220	496,320	485,840	490,210	3,041,230				
Baht	1,363,215	1,344,300	1,356,018	1,328,857	1,337,020	1,349,371	8,078,782				
	Table 4.4 Electricity Cost from Jun to Nov 2005										

Table 4.4 represents electricity cost and power units (KW.HR) consumed by the company from Jun to Nov 2005. Electricity cost is divided into 2 categories, which are manufacturing and non-manufacturing electricity cost. The first is provided to manufacturing area, and the second is provided to three areas in the company. Those are centre office, QA&ENG office, and dormitory. How much each area consumes electricity cost is calculated by using the power unit that each area consumes. In order to measure power unit, it requires Kilowatt Hours Meter. However, there is only dormitory area having such meter. Thus, it is necessary to estimate power unit of the remainders. The way to estimate needs to identify firstly the power (KW) of equipments or machines in each area, secondly how long they operate within a day, and finally how

many day they operate. The power unit of each area is derived by multiple of those three factors.

The estimation of power units of each area illustrates in table 4.5. Note that, power units in manufacturing area can be calculated by subtracting total power units with power unit in dormitory, centre office, and QA&ENG office. The outcome of estimation is percentage of usage, which is used to calculate electricity cost of each area. Table 4.6 shows electricity cost in each area. The first three electricity costs, which is non-manufacturing electricity cost, will be combined with man power cost. This will be explained in man power cost section.

Area	Equipments	ĸw	Hr./Day	No. of Working Days (Jun – Nov)	Power Units (KW.HR)	% Usage	
Centre Office	Air Condition	5.25					
	Light	0.90	8	156	9,547	0.31	
	Computer and etc.	1.50					
QAŊ Office	Air Condition	2.25				0.50	
	Light	0.30	24	170	15,300		
	Computer and etc.	1.20					
Dormitory	-	-	-	-	14,304	0.47	
Manufacturing	-	-	-	-	3,002,079	98.71	
				Total	3,041,230.00	100.00	

Table 4.5 Estimation of Electricity Cost in each area

Area	% Usage	Baht
Centre Office	0.31	25,361
QAŊ Office	0.50	40,643
Dormitory	0.47	37,997
Manufacturing	98.71	7,974,780
Total	100.00	8,078,782

Table 4.6 Electricity cost in each area

4.1.5 Water

The total water cost from Jun – Nov is shown in table 4.7. Similar to electricity, the consumption of water within the company can be divided into two different areas, which are manufacturing and non-manufacturing area. Unfortunately, there are no water meters to measure water consumption of both areas. Therefore, it is necessary to estimate water consumption of both areas. This can be done by interviewing experienced people. By interviewing, the company approximately consumes water

about 24 m^3 per day, which contributes to manufacturing and non-manufacturing area by 15 m^3 and 9 m^3 or 62.5% and 37.5% respectively. Thus, water cost distributed to both areas is 52,906 and 31,744 baht as shown in table 4.8. Water cost distributed to non-manufacturing area will be combined with man power cost in next section.

Jun	Jal	Aug	Sep	Oct	No		Total
7,000	7,700	18,600	28,700	8,40	00 14,	250	84,650
	Table 4	.7 Water of	ost from	Jun – N	lov 2005		
	A	reas	% Us	age	Baht	-	
	Manufact	turing		62.50	52,900	5	
	Non-Mar	nufacturing		37.50	31,744		
	т	`otal	1	00.00	84.65	5	

 Table 4.8 Water cost distribution

4.1.6 Man Power

Man power is divided into salary and direct labour cost. Man power cost will be combined with non-manufacturing electricity and water, fringe benefit, communication, and office accessory cost. The former of this section will explain the details of salary and direct labour. The latter will explain combining man power cost with those five costs.

4.1.6.1. Salaries

To describe this cost group, it is necessary to refer organizational structure of the company (Table). Persons in top management level are share holder. They have no responsibility within company. Thus, they do not get any payment. The middle management level consists of two persons. One is General Manager and the other is Plant Manager. Definitely, these two persons are salaried. In staff level, there are 9 people salaried. They are Chief Production Department, Chief Moulding Division, Chief Melting Division, Chief Grinding Division, Assts. Chief Engineering Department, Assts. Chief QA Department, and Administrative staff 1, 2, and 3. Table 4.9 represents their salary costs from Jun – Nov 2005.

Salary	Total (Jun – Nov)
General Manager	295,223
Asst. Plant Manager	156,000
Chief Production Department	87,453
Chief Moulding Division	71,926

Chief Melting Division	75,672
Chief Grinding Division	90,733
Asst. Chief Engineering Department	65,896
Asst. Chief QA. Department	57,774
Sale/Purchase Staff	82,800
Accounting Staff	46,000
Human Resource Staff	38,400
Total	1,067,877

Table 4.9 Salary Cost from Jun – Nov 2005

4.1.6.2. Direct Labours

According to organizational structure, besides people gets pay as salary, there are groups of people who get pay as wages. These groups of people can be separated into 9 groups as shown in table 4.10. The classification bases on function they operate in.

Groups	No. of Persons	Jun	Jal	Aug	Sep	Oct	Nov	Total
Melting	14	111,307	111,081	106,581	96,693	101,116	108,038	634,816
Moulding (AMF)	9	70,629	61,554	57,195	66,374	64,233	72,379	392,364
Moulding (FD)	7	60,874	69,674	61,694	74,119	80,397	81,657	428,415
Core	4	23,960	25,741	29,045	16,690	30,379	27,838	153,653
Grinding	32	208,884	224,011	203,176	197,327	242,365	214,369	1,290,132
QC.	7	36,940	34,970	39,335	32,321	43,081	38,721	225,368
QA.	4	32,133	29,400	28,253	27,983	28,031	29,644	175,444
Maintenance	4	34,382	31,028	30,981	28,833	27,747	31,313	184,284
Driver	5	38,780	34,057	35,719	32,510	38,440	35,511	215,017
Total	86	617,889	621,516	591,979	572,850	655,789	639,470	3,699,493

Table 4.10 Direct Labour Costs from Jun - Nov 2005

4.1.6.3. Combining man power cost with the five costs

As mentioned above, there are five costs combined with man power cost. Those are fringe benefit, non-manufacturing electricity, non-manufacturing water, communication, and office accessory cost. These five costs are assigned to each person as shown in table 4.11. To whom costs are distributed represents by "*".

部	State of the	1	大学	Non-N	landac lectricit	toring y	Sec.		でおり
A CONTRACTOR OF A CONTRACTOR A		No. of Persons	Fringe Benefit	Centre Office	QAŊ Office	Dormitory	Water	Communication	Office Accessories

	Driver	5	*			*	*		
	Total	97	97	5	7	91	97	8	8

Table 4.11 Distribution of the five costs

4.1.6.3.1. Fringe Benefits

Fringe benefits are such as uniform suit, social insurance, hospital fee, security, etc. Table 4.12 illustrates fringe benefit cost from Jun – Nov 2005. It is appropriate to approximate all persons within the company getting fringe benefits equally. Therefore, fringe benefit cost is distributed to each person at 307,624/97 = 3,171 baht/person.

Month	Baht
June	45,992
July	88,151
August	41,475
September	44,309
October	44,285
November	43,412
Total	307,624

Table 4.12 Fringe Benefit Cost from Jun – Nov 2005

4.1.6.3.2. Non-Manufacturing Electricity

According to table 4.5, non-manufacturing electricity costs, which are distributed to central office, QA&ENG office, and dormitory area, are 25,361, 40,643, and 37,997 baht respectively. The number of people working in these 3 areas is 5, 7, and 91 people regarding to table 4.11. It could be said that people working in each area consume each electricity cost at the same proportion. Therefore, electricity cost rates of each area are 25,361/5 = 5,072 Baht/Person, 40,463/7 = 5,806 Baht/Person, and 37,997/95 = 418 Baht/Person respectively.

4.1.6.3.3. Non-Manufacturing Water

As mentioned in water cost section, non-manufacturing water cost from Jun – Nov 2005 is 31,743 Baht. It is appropriate to approximate that all persons within the company consume water equally. Thus, non-manufacturing water cost is distributed to each person at 31,744/97 = 327 baht/person.

4.1.6.3.4. Communication

This cost includes phone, fax and internet expense. Table 4.13 shows communication cost from Jun – Nov 2005. Generally, persons consuming this cost are those who work in central and QA&ENG office. Approximately, they consume this cost at the same rate. Thus, this cost is distributed to each person at 32,636/8 = 4,080 baht/person.

4.1.6.3.5. Office Accessories

Office accessories are such as paper, printer and copy machine ink, files, etc. Table 4.13 shows office accessory cost from Jun – Nov 2005. Similar to communication cost, there are only persons working in central and QA&ENG office consuming this cost. Normally, they use the accessories at the same proportion. Therefore, it can conclude that each person consumes this cost at 76,956/12 = 6,413 baht/person.

	Jun	Jui	Ang	Sep	Oct	Nov	TONE
Communication	4,651.33	6,231.73	4,841.53	4,611.81	7,600.21	4,699.87	32,636

Table 4.14 Total Man Power Cost

4.1.7 Transportation Expenses

Transportation expense consists of travelling expenses and fuel. Travelling expenses are such as express way fees, car insurance, maintenance, etc. Fuel is consumed by trucks and forklifts in order to deliver products and move materials in the company respectively. Transportation expense from Jun – Nov 2005 are illustrated in table 4.15.

Transportation Expenses	Jan	, Jul	Aug	Sep	Oct	Nov	Total
Travelling Expenses	11,561	31,348	10,887	107,997	23,759	24,529	210,081
Fuel	46,492	62,385	101,447	72,317	92,273	73,442	448,355

Table 4.15 Travelling and Fuel Expenses from Jun - Nov 2005

4.1.8 Miscellaneous Expenses

All expenses unable to be grouped into any cost group described above will be grouped into miscellaneous expense. These expenses are such as technical assistance, accounting consultant, water system installation, entertainment, fees, etc. Miscellaneous Expense from Jun to Nov 2005 is shown in table 4.16.

Jun	Jul	Aug	Sep	Oct	Nov	Total		
95,986	118,339	191,850	248,866	108,975	24,385	788,401		
Table 4.16 Misselleneous Cost from Jun Nov 2005								

 Table 4.16 Miscellaneous Cost from Jun – Nov 2005

4.1.9 Depreciation

Fixed assets brought to calculate deprecation will include buildings, office accessories, vehicles, machines and tools & equipments. Total deprecation from 1 Jan to 31 Dec 2005 is 3,948,129. Note that, this study will not consider the time when fixed assets are bought or built, but all fixed assets are assumed to exist from the beginning of year 2005. Therefore, depreciation from Jun to Nov 2005 is approximately (3,948,129/12)*6 = 1,974,064 Baht as shown in table 4.17.

Fixed Assets	Baht
Buildings	478,661
Office Accessories	9,665
Vehicles	99,059
Machines and Tools & Equipments	3,360,744
Total (12 Months)	3,948,129
Total (6 Months)	1,974,064

Table 4.17 Depreciation from Jun – Nov 2005

In summary, the final cost groups that are appropriate to perform cost assignment are shown in figure 4.2. The total cost is 24,060,400 + 2,900,988 + 2,717,963 + 7,974,780 + 52,906 + 1,235,169 + 4,085,162 + 788,401 + 658,436 + 1,974,064 = 22,387,869 Baht. The next step is to assign theses cost groups to activities identified from previous chapter.

Figure 4.2 Final Cost Groups

4.2 Assigning Resource Costs to Activities

In this section, 10 cost groups organized in previous section will be assigned to activities. The assignment can be done through three different ways. Those are direct charging, estimation, and arbitrary allocation.

It is apparent that cost groups that can be assigned to activities by direct charging are indirect materials, tools & equipments and maintenance. The remainders, which are manufacturing electricity, manufacturing water, salary, direct labour, and transportation, will be allocated to activities by estimation. Note that, miscellaneous and depreciation (788,401 and 1,974,064 Baht) costs are the expenses that are not required by any activity in process. Thus, they will not be assigned to activities, but they will be combined to infrastructure sustaining activity costs later on.

4.2.1 Indirect Materials

According to section 4.1.2, indirect material costs are 2,900,988 Baht. These costs will be assigned to activities by direct charging as shown in table 4.18.

4.2.3 Manufacturing Electricity

According to section 4.14, manufacturing electricity cost is 7,974,780 Baht. This cost will be assigned to concerned activities. The concept of assigning this cost to activities is similar to that of assigning electricity cost to manufacturing and nonmanufacturing area within the company. The concept requires estimation of power units (KW.HR) consumed by machines in each activity. Table 4.20 represents the estimation of power units consumed by activities. Note that, time interval for estimation is considered within 24 hours due to the company operates both day and night shift.

Table 4.20 Assigning Manufacturing Electricity Cost to Activities

Regarding to table above, the fourth column, Power (KW), represents electrical power required by machines in activities. The fifth column, Cycle Time (HR.), represents how long machines operate in one cycle. Thus, power units consumed within a cycle (KW.HR/Cycle) is calculated by multiplying power (KW.) with Cycle Time (HR). This represents in column six. In seventh column, it represents the number of cycle time machines operate within 24 hours. The total power units consumed within 24 hours represent in column eight. This can be calculated by multiplying Power Units/Cycle with Number of Cycle time/24 HR. Finally, the last column represents percentage of power consumption consumed in each activity. As a result, manufacturing electricity cost incurred in each activity is shown in table 4.21.

Table 4.21 Manufacturing Electricity cost assigned to Activities

4.2.4 Manufacturing Water

Regarding to section 4.15, water consumption in manufacturing area is 15 m^3 and its cost is 52,906 Baht. Assigning this cost to activities requires estimation of water consumption consumed by activities during day and night shift. By interviewing experienced people, water is consumed by major four activities. Those are A1313, A1323, A1326, and A13281. How much each activity consumes water and water cost distributed in each activity are shown in table 4.22.

Act D	Activities	M3 1.	2%	Baht

	Total	15.00	100.00	52,906

Table 4.22 Assigning Manufacturing Water Cost to Activities

4.2.5 Man power

4.2.5.1. Salaries

There are 11 people who are salaried. Assigning salary cost to activities needs to estimate how much each person puts efforts on activities. This can be done through Time-Effort Input Sheet as shown in table 4.23. Data such as who get involve in and how much they put efforts on activities can be acquired by interviewing those people. As a result, salary costs distributed to activities are shown in table 4.24.

Table 4.24 Assigning Salary costs to Activities

4.2.5.2. Direct Labours

Before assigning direct labour costs to activities, it is important to know that direct labours are divided to 2 groups. The first group is people who are responsible for single task, and the second is those who are responsible for multi tasks. Therefore, assigning costs of 2 groups of people will be different as follow.

4.2.5.2.1. Assigning single task direct labour costs to activities

Groups of people responsible for single task are such as core, grinding, QC, and driver group. Regarding to section 4.1.6.3, total costs of each group are 169,318, 1,415,450, 252,781, and 234,598 Baht, and the number of people of each group is 4, 32, 7, and 5 respectively. Who and how many person is involved in which activity is determined in table 4.25 (left-side). Due to wage rate of people in these group is slightly

different and time-efforts of each person put in each activity is nearly same, it is appropriate to assume that each person in each group gains wage at the same rate.

As a result, from Jun – Nov 2005, each person in core, grinding, QC, and driver group will approximately gain wage at (169,318/4) = 42,329 Baht/person, (1,415,450/32) = 44,233 Baht/Person, (252,781/7) = 36,112 Baht/Person, and (234,598/5 = 46,920 Baht/Person) respectively. Therefore, costs of single task direct labour are distributed to activities in relation to the number of people in each activity as shown in table 4.25.

		No. of	People		Sin	gle Task Dire	ct Labour (Costs

Table 4.25 Assigning Single Task Direct Labour Costs to Activities

4.2.5.2.2. Assigning multi tasks direct labour costs to activities

Groups of people responsible for multi tasks are such as melting, moulding (AMF), moulding (FD), and maintenance. Regarding to section 4.1.6.3, their total costs are 687457, 426204, 454735, and 199324 Baht respectively. People in these groups can work various activities not only within their own activities but also across to other functions. In addition, they can work interchangeably. Therefore, assigning these costs

to activities requires estimation of time-efforts put on activities during day and night shift. By interviewing people these groups, time-efforts of each group put on activities and cost of each group distributed to activities are illustrated in table 4.26.

Table 4.27 Assigning Man power cost to activities

4.2.6 Transportation Expenses

Regarding to section 4.1.7, transportation expenses consists of travelling expenses and fuel. There is only one activity consuming travelling expenses. It is "Deliver Products", A25. Thus, 100% of this expense will be assigned to such activity. Fuel is consumed by two activities, which are "Deliver Products" (A25) and "Perform Handling Materials" (A5). There are trucks and forklifts used in A25 and A5 respectively. Thus, in order to assign fuel cost to those 2 activities, it is necessary to estimate fuel consumption of trucks and forklifts. By interviewing drivers, fuel consumption of trucks and forklifts is approximately about or 70% and 30% respectively. As a result, costs of fuel distributed to trucks and forklifts are represented in table 4.28.

Act ID.	Travelling Expenses	Fuel	Travelling Expenses (Baht)	Fuel (Baht)	Total (Baht)
A25	100.00	70.00	210,081	313,849	523,930
A5	0.00	30.00	0	134,507	134,507
Total	100.00	100.00	210,081	448,355	658,436

Table 4.28 Assigning Transportation Expenses to Activities

In summary, all costs assigned to activities will be combined together in order to calculate total cost of each activity as shown in table 4.29. Figure 4.3 shows cost flow model from resource costs to activities.

Table 4.29 Assigning Resource Costs to Activities

Figure 4.3 Cost Flow Model from Resources to Activities

However, it should recognize that support activities, A4 and A5, are not directly consumed by cost objects. Rather, they are consumed by other activities. Therefore, it is necessary to assign support activity costs to the activities before assigning activity costs to cost objects is performed. The assignment of support activity costs to other activities will be explained in next section.

4.3 Assigning Support Activity Costs to other Activities

Due to support activities consisting of performing maintenance tasks (A4) and material handling (A5) activity do not directly benefits to cost objects but to other activities, their costs will be assigned to such activities instead of cost objects. Assigning both A4 and A5 cost can be done by estimating time-efforts of each team spent in activities.

Performing maintenance tasks are provided to 4 parts, which are melting, moulding, finishing process, and infrastructure sustaining. Melting team is responsible for maintaining machines and equipments used in melting process (A4.1), and maintenance team will responsible for maintaining those used in moulding process (A4.2), finishing process (A4.3) and infrastructure (A4.4). It should recognize that cost of maintaining infrastructure activity (A4.4) is not required by product and customer activities. This cost, 948,859 Baht, will not be assigned to any product and customer activities, but they will be combined with infrastructure sustaining activity costs. For performing material handling task (A5), driver team is in charge.

As a result, by interviewing people in maintenance and driver team, percentage of time-efforts spent in each activity and total support costs allocated to each activity are shown in table 4.30. These support costs will be combined to activity costs as shown in table 4.31, and figure 4.4 illustrates cost flow model from support activity costs to product and customer activities. Note that, the total support cost is 889,951 Baht due to 948,859 baht is assigned to infrastructure sustaining.

Table 4.31 Total Activity Costs

Figure 4.4 Cost Flow Model from Support Activity Costs to other activities

In summary, all resource costs have been traced to product, customer, and infrastructure sustaining activities. Total costs of each group are 16,827,036, 1,136,579, and 712,930 Baht respectively. Note that, infrastructure sustaining activity costs have to be combined with depreciation (1,974,064), miscellaneous (788,401 Baht), and maintaining infrastructure activity (A4.4) (948,859 Baht) costs. Thus, the total infrastructure sustaining activity cost is 4,424,254 Baht.

Summation of these three costs is **22,387,869** Baht, which is exactly the same number of total resource costs as describe in section. It indicates that no costs can be created or destroyed. Rather they are distributed to the appropriate locations. Figure 4.5 illustrates the percentage of costs accumulated in each activity group. It indicates that 75% of total costs are provided to product activities. 20% and 5% of total costs are provided to infrastructure sustaining and customer activities.

Figure 4.5 Cost of each activity group

At this point, it can conclude that the step of assigning resource costs to activities is accomplished. The next step in developing cost flow model is to assign activity costs to cost objects. This step will be described in next section.

4.4 Assigning Activity Costs to Cost Objects

In this section, total activity costs calculated from previous section will be assigned to cost objects. Assigning activity costs to cost objects can be done through activity cost driver. Activity cost drivers measure the frequency and intensity of the demands placed on activities by cost objects. On the other hand, activity cost drivers trace and reassign activity costs to their cost objects in direct proportion to the objects' consumption of the activity.

The criteria to identify activity cost drivers should consider what causes differences in the level of effort in the activity. In addition, it should realize that cost drivers should ideally be discretely measurable in quantity (in order to determine activity cost rate) and traceable to unique cost objects. The number of activity cost drivers is also important. It should consider the trade off between the effort to collect extra data, accuracy, and the amount of precision the end-users needs for decision making. The activity cost driver of each activity is listed in table 4.32.

Act. ID	Activities	Ret. Type	Beloity Cost Differen

Table 4.32 Activity Cost Driver List

Next paragraphs will describe assigning activity costs to cost objects through these activity cost drivers. In this study, cost objects are divided into 2 categories. Those are product and customer cost objects. Thus, cost assignment from activity costs to cost objects is divided into assigning product activity costs to product cost objects and assigning customer activity costs to customer cost objects.

4.4.1 Assigning Product Activity Costs to Product Cost Objects

This cost assignment requires the output quantity data of each activity cost driver to determine cost driver rate. The data can be captured mostly from operational data such as melting, moulding, finishing, and QA reports. The cost driver rate is calculated by dividing activity costs by its output quantity (Cost Driver Rate = Activity Costs/Output Quantity). Table 4.33 shows activity cost drivers, output quantity, and activity cost rate of each product activity. The data of some output quantity are shown in appendix A. There are 27 product activities. Activities having the same activity cost driver will be grouped together. Note that, direct labour cost is separated from total activity costs. Therefore, cost driver rate will be divided to direct labour cost rate and

rate. Both can be calculated as Direct labour Cost Rate = Direct labour Cost/Output Quantity and Activity Cost Rate = Activity Cost/Output Quantity.

Table 4.33 Product Activity Cost Rate

Determining consumption of the activities by cost objects can be done by multiplying cost driver rate with the demand placed on activities required by cost objects. The demand placed on activities is called activity output. Thus, in each activity, consumption of direct labour cost of each product is calculated by multiplying its direct labour cost rate with its activity output. Similarly, in each activity, consumption of activity cost of each product is calculated by multiplying its activity cost rate with its activity output. Similarly, in each activity cost rate with its activity output. From Jun to Nov 2005, there are over a hundred products produced by the company. In this study, only five products will be described as examples. They are Flywheel ZE1, HUB KD, Slider, Body10DJ150, and Flange Air. Table 4.34 and 4.35 represent the consumption of product activities by these products.

Total Cost (%)	100.00	100.00	100.00	100.00	100.00

Table 4.36 Direct Labour and Activity Cost built up by the products

4.4.2 Assigning Customer Activity Costs to Customer Cost Objects

There are 7 customer activities. Similar to previous section, assigning customer activity costs to customer cost objects requires collecting the output quantity of activity cost drivers in order to determine cost driver rate. Cost driver rate is calculated by dividing Total Activity Cost by Output Quantity as shown in table 4.37. Note that, direct labour costs are not separated from total activity costs due to the amount between direct labour and activity costs is significant different.

					Total	618,494.00	76,874.32	67,506.47	30,347.48

Table 4.38 Consumption of customer activities by customer cost objects

In summary, it is apparent that ABC provides insights of how the diversity and variation of products or customers can be detected and translated into how they uniquely consume activity costs. This capability is not available in traditional or current costing system. However, gaining such information is not enough for this study. The objective is to build more accurate costing system. Consequently, the study will go forward to determine cost constructed in the level of product unit.

4.4.3 Product Costing

Product unit cost is calculated by dividing total cost by units of product produced as shown in figure 4.6. Total cost of each product is constructed with product activity cost, direct labour cost, customer activity cost, direct material cost, and infrastructure sustaining activity cost. The first two have already discussed in section 4.41. The last three requires three more cost assignments. Those are assigning customer cost objects, direct material costs, and infrastructure sustaining activity costs, and infrastructure sustaining activity costs to product cost objects. Each cost assignment is described as follow. The same five products will be used as examples.

Figure 4.6 Product unit cost calculations

4.4.3.1. Assigning customer cost objects to product cost objects

Similar to previous cost assignment, the way to assign customer cost objects to product cost objects can be done through a cost driver. Also, such a cost driver should be quantifiable and link product to customer cost objects. It could be said that the level in each customer cost put on their own products varies in relation to the number of ladles. Thus, this requires determining each customer cost per ladle (customer cost rate). The calculation of customer cost rate is shown in table 4.39. Each customer cost rate is used to determine customer cost distributed to their own product as shown table 4.40.

Customer	(A) Customen Costs	(B) Oniput Quantity (Ladics)	(A/B) Custonen Gost Rate (Balt/Cardle)
SBM	618,494.00	5,883	105.13
KITZ	76,874.32	456	168.58
ККС	67,506.47	389	173.54
AI	30,347.48	186	163.16

Table 4.39 Customer cost rate (Baht/Ladle)

Customer	Product	Cost Rate (Bahi/Ladic)	No. of Ontput (Ladles)	Total Cost (Baht)
SBM	ZEI	105.13	2,493	262,095
SDIVI	HUB KD	105.13	1,124	118,169
ккс	Slider	173.54	389	67,506
KITZ	Body 10DJ149	168.58	35	5,900
AI	Flange Air	163.16	75	12,237

Table 4.40 Assigning customer costs to the products

4.4.3.2. Assigning direct material costs to product cost objects

Regarding to section 4.1.1, direct materials are classified into three groups such as metal and chemical compositions, sand and sand compositions, and shell sand. Metal and chemical compositions can be further divided into those used for producing Ferro Carbon (FC) and Ferro Carbon Ductile (FCD). Sand and sand composition can also be further divided into those used in AMF, FD1, and FD2 moulding line.

4.4.3.2.1. Assigning metal and chemical composition costs to products

Different products require different quantity of metal and chemical composition. Determining how much the quantity of metal and chemical compositions required by each product can be done through number of ladle. Metal and chemical compositions are divided to those for FC and FCD. Cost of each is 17,759,620 and 3,266,477 Baht regarding to section 4.1.1. From Jun – Nov 2005, the number of ladle used to produce FC and FCD are 6,802 and 1,081 ladles. Thus, metal and chemical composition cost per ladle (Cost Rate) for FC and FCD are represented in table 4.41. Table 4.42 represents metal and chemical composition cost assigned to the five products.

	(A) Material Cost (Baht)	(B) Output Quantity (Ladles)	(A/B) Cost Rate (Baht/Ladle)
Metal and Chemical Composition for FC	17,759,620	6,802	2,610.94
Metal and Chemical Composition for FCD	3,266,477	1,081	3,021.72
Total	21,026,096	7,883	

Table 4.41 Metal and chemical composition cost per ladle for FC and FCD

Materials	Products	(A) Cost Rate (Baht/Eadic)	(B) No. of Output (Ladles)	(A*B) Total Cost (Baht)
FC	ZE1	2,610.94	2,493	6,509,075
FC	HUB KD	2,610.94	1,124	2,934,697
FC	Slider	2,610.94	389	1,015,656
FCD	Body 10DJ150	3,021.72	35	105,760
FC	Flange Air	2,610.94	75	195,821

Table 4.42 Metal and Chemical composition costs required by the products.

4.4.3.2.2. Assigning sand and sand compositions to products

Sand and sand compositions are provided to AMF, FD1, and FD2 moulding line. Regarding to section 4.1.1, their costs are 2,706,241, 47,432, and 20,328 Baht respectively. It is appropriate to assume that the quantity of sand and sand composition in each moulding line varies in relation to the number of sand mould produced in each moulding line. Table 4.43 represents cost per sand mould in each moulding line. Table 4.44 represents the cost required by these 5 products.

Moulding Line	(A) Material Cost (Baht)	(B) Ontput Quantity (Mould)	(A/B) Cost Rate (Babt/Mould)
AMF	2,706,214	217,275	12.46
FD1	47,432	43,552	1.09
FD2	20,328	1,526	13.32
Total	2,773,974		

Moulding Line	Products	(B) Cost Rate (BAB/Mould)	(A) No. of Output (Mould)	(A*B) Total Cost (Baht)
	ZE1	12.46	72,468	902,607
	HUB KD	12.46	33,903	422,270
AMF	Slider	12.46	13,686	170,463
	Body 10DJ150	12.46	1,003	12,493
	Flange Air	12.46	2,228	27,750

Table 4.44 Sand cost required by the products

4.4.3.2.3. Assigning shell sand cost to products

Different products require different quantity of resin sand. The variable determined the quantity of resin sand required by each product is weight of resin sand. From Jun – Nov 2005, the company bought resin sand at 3.91 Baht/Kg. The products requiring resin sand are only Body 10DJ150 and Flange Air. Thus, cost of resin sand required by these products is shown in table 4.45.

Products	(A) No. of Output (Kg)	(3) Cost Forte (Baby SC)	(A*B) Total Cost (Baht)
Body 10DJ150	1,213.63	3.91	4,750
Flange Air	2,989.98	3.91	11,702

Table 4.45 Resin sand cost distributed to the products

4.4.3.3. Assigning Infrastructure Sustaining costs to product cost objects

As described previously, infrastructure sustaining costs including depreciation and maintaining infrastructure activity costs are 4,424,254 Baht. It could be said that assigning this cost to products can be done through the time required by producing the products. Time can approximately represent in term of number of ladle. The higher number of ladle is produced, the longer time is required. According to table 4.39, the total number of ladle is 7883 ladles. Thus, business sustaining costs per ladle is 4,424,254/7883 = 561.24 baht/ladle. Table 4.46 represents the number of ladle required by each product and infrastructure sustaining costs distributed to each product.

Product	(B) Cost Rate (Baht/Ladle)?	(A) No. of Output (Ladle)	(A-B) Total Cost (Baht)
ZE1	561.24	2,493	1,399,171
HUB KD	561.24	1,124	630,834
Slider	561.24	389	218,322
Body 10DJ150	561.24	35	19,643
Flange Air	561.24	75	42,093

Table 4.46 Infrastructure Sustaining Costs distributed to the products

Finally, all costs are traced from resources to final cost objects. Figure 4.7 illustrates cost flow model from resources to final cost objects.

Figure 4.7 Cost Flow Model from Resources to Final Cost Objects

As a result, all costs are gathered to determine the total cost of each product. Table 4.47 shows the cost structure of those five products. The table represents each product's unit cost calculated by dividing total cost by number of product produced. These numbers are extracted from defects and claims. In addition, the table compares between sale price and cost of each product to determine which products the company profits or loses. Interestingly, the company did lose in HUB KD and Flange Air about 10.85% and 29.77% respectively. Table 4.48 and figure 4.8 represent each product cost structure in percentage. It reveals how diversity and variation in product creates different cost structure.

Cost	Flywheel ZE1	HUB KD	Slider	Body10DJ150	Hange Air
Metal and Chemical compositions	6,509,075	2,934,697	1,015,656	105,760	195,821
Sand and Sand compositions	902,607	422,270	170,463	12,493	27,750
Resin Sand	0	0	0	4,750	11,702
Direct Labour	657,242	460,447	389,676	15,927	59,119

 Table 4.48 Percentage of Product Cost Structure

Figure 4.8 Cost Structure in percentage of the products

In conclusion, this chapter performs vertical cost assignment of CAM-I Cross. It reveals how resources and activities relate to cost objects. Costs are traced from resources to final cost objects by two cost assignments, assigning resource costs to activity and then reassigning activity costs to cost objects. The cost assignment view provides useful information of how diversity and variation in product and customer impact to product cost structure. It provides more reliable picture of cost structure. This allows management to understand what high-cost activities are, which product profit or lose, what product and customer channel should focus, etc, and also allows management to identify opportunities for improvement. This information is not available in the company current costing system. Consequently, it can conclude that, at this point, the first objective of this study, developing more reliable and accurate costing system, is accomplished.
