 FU GANG ANALYSIS OF NUTRITIONAL STATUS AND FOOD CONSUMPTION IN
 CHINA. THESIS ADVISOR: ASSOC. PROF. PONGSA PORNCHAIWISESKUL,
 PH.D. 94 pp. ISBN 974-346-005-5

The objectives of this study are to describe the current nutrition status and nutritional evaluation of China, to analyze the relationship between nutrition status and food consumption at household level of China. Descriptive nutritional analysis and multivariable regression analysis by different regions were used in this study. There are two parts of cross-sectional data sets to be adopted in this study, growth performance of preschool children data and household information, which were collected in 1998 by Chinese Food and Nutrition Surveillance System and State of Statistics Bureau of China.

The result of descriptive nutritional analysis showed that, since unconscionable diet pattern and over consumption of high fat food, over-nutrition and obesity had been becoming primary problem in urban areas. In rural areas, under-nutrition and the change of household food consumption should be paid more attention, especially to low-income group.

Constant elasticity models were employed in this study in order to measure the relationship between nutritional status and household information by different regions. The deviation score of DDP for major foods would be dependent variables in the models estimated. The explanatory variables consist of household income, household size, education level of both household head and the spouse, and some of major food prices. This study produced consistent and important result. It showed that there were important ways in which price changed could affect the consumption of various observations groups and that price change had a differential effect to different groups of people. At the same time, some of factors, such as educational level of household head and the spouse had no statistical significance.

Acknowledgment

I would like to express my appreciation to Dr. Pongsa Pornchaiwiseskul, my thesis advisor, for his active and resultful guidance, and his invaluable time devoted to the improvement to my thesis. Without his close supervision, I could not finish my thesis on time.

I also wish to thank Dr. Phitsanes Jessadachatr, as the chairman in my committee, Asst. Prof. Kaemthong Indaratna, member of committee, Assoc. Prof. Isra Sarntisart, member of committee, and Asst. Prof. Paitoon Kaipornsak, member of committee, for their kindly support and useful suggestion.

Special thanks must go to WHO and Nestlé Nutrition Scholarship Committee, which support me partial fellowship and 12 months scholarship for my study and living in Bangkok.

Herein, I would like to express my great gratitude to Prof. Chen Chunming, the former president of Chinese Academy of Preventive Medicine and also the director of Chinese Nutrition Programme, for her constant encouragement and self-giving support in my study from beginning to end.

I would like to thank to all of my friends, i.e. Wongduem, Pim, Wanida, Juni, Feroza, Phu, Kyaw, Subhas, Anis and Sombat, for their cooperation and encouragement.

Last, but not at all least, I also want to give my deeply thanks to Mr. Jiang tao, Ms. Jiang Yuan, Mr. Wang Yuying and other colleagues in Chinese Academy of Preventive Medicine, as well as my wife, my family and my friends who love me and help me. Their support and regard accompany me in my study throughout.

Fu Gang
